

**PRODRUGS**Technical Field

5 This invention relates to the field of prodrugs, that is novel derivatives of otherwise known and proven drugs which release that drug in active or pro-active form in vivo. The enzymatic and/or chemical cleavage of the compounds of the present invention occurs in such a manner that the parent drug is released and the moiety or moieties split off remain non-toxic or are metabolized so that non-toxic or acceptable amounts of metabolic products are produced. The present compounds thus modify the in vivo  
10 availability of the parent compound compared to what would be the case if the parent compound was to be administered itself. For instance the prodrugs of the invention may give higher bioavailabilities, varied bioavailability kinetics or bioavailabilities with a decreased interpersonal spread.

15 A first aspect of the invention relates to the field of nucleoside analogues, such as antivirals including inhibitors of retroviral reverse transcriptase and the DNA polymerase of Hepatitis B Virus (HBV). The invention provides novel compounds with favourable pharmaceutical parameters, methods for their preparation, pharmaceutical compositions comprising these compounds and methods employing  
20 then for the inhibition of viral and neoplastic diseases including HBV and HIV.

Background to the invention

International patent application no. WO 88/00050 describes the antiretroviral and anti-HBV activity of a series of 3'-fluorinated nucleosides, including the compounds 2',3'-dideoxy, 3'-fluoroguanosine (FLG) and 3'-fluorothymidine (FLT). The latter  
25 compound underwent clinical evaluation as an anti-HIV agent and although its antiviral activity and pharmacokinetics were good, it showed unexpected toxicity (Flexner et al, J Inf Dis 170(6) 1394-403 (1994)). The former compound FLG is very active in vitro however the present inventors have detected that its bioavailability is so poor - around 4% - that the in vivo utility of the compound has thus far been  
30 limited to intraperitoneally or subcutaneously administered animal models.

10015184-11501

US patent 4,963,662 discloses generically a series of 3'-fluorinated nucleosides and corresponding triphosphates and specifically describes the preparation of the 5'-O-palmitoyl derivative of FLT, without reporting any improvement in bioavailability. International patent application WO 93 13778 describes FLG derivatives modified at the 6-position of the base, in particular with n-propoxy, cyclobutoxy, cyclopropanylamino, piperidino or pyrrolidino. International patent application no. 93 14103 describes FLG derivatives where the oxygen at the guanine 6-position is replaced with amino, ether, halo or sulphonate.

### Brief description of the invention

- 10 In accordance with one aspect of the invention there are provided compounds of the formula I:

wherein:

R<sub>1</sub> is selected from

- 15 hydroxy, amino or carboxy; optionally having esterified/amide bonded thereon a C<sub>4</sub>-C<sub>22</sub> saturated or unsaturated, optionally substituted fatty acid or alcohol, or an aliphatic L-amino acid;

R<sub>2</sub> is the residue of an aliphatic L-amino acid;

L<sub>1</sub> is a trifunctional linker group;

- 20 L<sub>2</sub> is absent or a difunctional linker group;  
and pharmaceutically acceptable salts thereof.

The invention further provides pharmaceutical compositions comprising the compounds and salts of formula I and pharmaceutically acceptable carriers or diluents therefor. Additional aspects of the invention provide methods for the inhibition of HBV and retroviruses such as HIV, comprising bringing a compound or

25

salt of the formula I in contact with a retrovirus or HBV, for example by administering an effective amount of the compound or salt to an individual afflicted with a retrovirus or HBV. The invention also extends to the use of the compounds or salts of formula I in therapy, for example in the preparation of a medicament for the treatment of retroviral or HBV infections.

In treating conditions caused by retroviruses such as HIV, or HBV, the compounds or salts of formula I are preferably administered in an amount of 50 to 1 500 mg once, twice or three times per day, especially 100 to 700 mg twice or thrice daily. It is desirable to achieve serum levels of the active metabolite of 0.01 to 100 µg/ml, especially 0.1 to 5 µg/ml.

Where  $R_1$  is a fatty acid residue, it preferably has in total an even number of carbon atoms, advantageously decanoyl ( $C_{10}$ ), lauryl ( $C_{12}$ ), myristoyl ( $C_{14}$ ), palmitoyl ( $C_{16}$ ), stearoyl ( $C_{18}$ ), eicosanoyl ( $C_{20}$ ) or behenoyl ( $C_{22}$ ). The fatty acid preferably has in total 10 to 22, and more preferably 16 to 20 carbon atoms, especially 18. The fatty acid may be unsaturated and have one to three double bonds, especially one double bond. Unsaturated fatty acids preferably belong to the n-3 or n-6 series. Convenient unsaturated  $R_1$  groups include those derived from the monounsaturated acids myristoleic, myristelaidic, palmitoleic, palmitelaidic, n6-octadecenoic, oleic, elaidic, gandoic, erucic, brassidic acids or multiply unsaturated fatty acids such as linoleic, γ-linolenic, arachidonic acid and α-linolenic acid. Preferably, however,  $R_1$  as a fatty acid is saturated as these compounds tend to have superior stability and shelf life.

$R_1$  as fatty alcohol residue preferably corresponds to one of the above described fatty acids. Alternatively the fatty alcohol may comprise residues of shorter alcohols, such as methanol, ethanol or propanol.

$R_1$  as a saturated or unsaturated fatty acid or alcohol may optionally be substituted with up to five similar or different substituents independently selected from the group consisting of hydroxy,  $C_1$ - $C_6$  alkyl,  $C_1$ - $C_6$  alkoxy,  $C_1$ - $C_6$  alkoxy  $C_1$ - $C_6$  alkyl,  $C_1$ - $C_6$  alkanoyl, amino, halo, cyano, azido, oxo, mercapto and nitro, and the like.

Suitable aliphatic amino acids for  $R_2$  and, if present  $R_1$ , include L-alanine, L-leucine, L-isoleucine and most preferably L-valine. For ease of synthesis it is preferred that both  $R_2$  and  $R_1$  are residues of aliphatic amino acids, preferably the same residue.

5

The expression trifunctional in the context of the first linker group  $L_1$  means that the linker has at least three functional groups, including at least two functional groups derived from respective hydroxy, amine or carboxyl groups, the amine and hydroxy function(s) being available for esterification/amide bonding with the carboxy functions of  $R_1$  and  $R_2$  whereas a carboxy function(s) on the linker is available for amide bonding with the free  $\alpha$ -amine function of  $R_2$ , or  $R_1$  as the case may be, or esterification with  $R_1$  as a fatty alcohol. Where  $R_1$  itself defines an hydroxy, amine or carboxy group, the hydroxy group being presently favoured of the three, one of said functions on the trifunctional linker simply comprises this hydroxy, amine or carboxy group.

15

The trifunctional linker further comprises a third functional group for linkage with either the optional second linker group  $L_2$  illustrated in more detail below, or the hydroxy group at the 5' position of the mother nucleoside, such as 2',3'-dideoxy-3'-fluoroguanosine. Appropriate third functional groups will depend on the nature of the cooperating function on optional linker group  $L_2$ , if present, and may include amino, hydroxy, carbonyl, sulfonyl, phosphoryl, phosphonyl, carbamoyl and the like. If  $L_2$  is absent, this third functional group on first linker  $L_1$  will typically comprise a carboxyl function which can esterify with the 5'-O group of the nucleoside analogue.

20

Preferably the functional groups on the trifunctional linker which cooperate with  $R_1$  and  $R_2$  are hydroxyl functions and the linkage is an ester linkage with the carboxyl functions of an  $R_1$  fatty acid, if present, and  $R_2$ . A further preferred embodiment comprises a free hydroxy group as  $R_1$  and an hydroxyl function on the linker esterified to the carboxy function of  $R_2$ . An alternative embodiment comprises an (optionally protected) carboxyl group as  $R_1$  and an hydroxyl function on the linker esterified to a carboxy function on  $R_2$ .

Sub  
B<sub>1</sub>

Useful trifunctional L<sub>1</sub> group, especially for esterifying directly to the nucleoside include linkers of the formula IIa or IIb:

5 where A and A' define a respective ester linkage between an hydroxy on the linker and the carboxy on R<sub>1</sub> or R<sub>2</sub> or an ester linkage between a carboxy on the linker and the hydroxy on R<sub>1</sub> as a fatty alcohol, or an amide linkage between an amine on the linker and a carboxy on R<sub>1</sub> or R<sub>2</sub>, or an amide linkage between a carboxy on the linker and an amine on R<sub>1</sub> or R<sub>2</sub>, or one of A and A' is as defined and  
 10 the other is hydroxy, amino or carboxy in the event that R<sub>1</sub> itself is a free hydroxy, amino or carboxy group.

R<sub>x</sub> is H or C<sub>1</sub>-C<sub>3</sub> alkyl,

T is a bond, -O- or -NH-;

Alk is absent, C<sub>1</sub>-C<sub>4</sub> alkyl or C<sub>2</sub> - C<sub>4</sub> alkenyl, optionally substituted as

15 described above; and

m and n are independently 0, 1 or 2.

In a preferred embodiment of this aspect of the invention, the R<sub>1</sub> or R<sub>2</sub> groups are each esterified to a respective one of the leftmost functional hydroxy groups (viz A and A') of Formula IIa, while the carbonyl moiety to the right is esterified, optionally  
 20 via a second linker group L<sub>2</sub>, to the 5'-O-group of the nucleoside.

Alternatively the L<sub>1</sub> group may comprise a linker of the formula IIb:

where Ar is a saturated or unsaturated, preferably monocyclic carbo- or heterocycle with 5 or 6 ring atoms; and

A, A', T, Alk, m and n are as defined above.

In Formula IIb, Ar is preferably an aromatic group such as pyridine or especially phenyl, such as aromatic moieties wherein the arms bearing the R<sub>1</sub> and R<sub>2</sub> groups are respectively para and ortho, meta and ortho, both ortho, or preferably para and meta, both para or both meta to the remainder of the linker.

In formulae IIa and IIb, the following combinations of m, n and Alk are presently favoured:

m	n	Alk
1	0	absent
1	0	methylene
1	0	ethylene
1	1	absent
1	1	methylene
1	1	ethylene
1	1	propylene
1	2	absent
1	2	methylene
1	1	ethenylene
1	1	propenylene

As R<sub>1</sub> and R<sub>2</sub> may have different structures, it will be apparent that many L<sub>1</sub> groups, particularly those of formula IIa, will define chiral structures and the invention

includes all enantiomers thereof, as racemates or as preparations of > 80%, preferably > 95% enantiomerically pure compound.

A favoured structure within formula IIa has the formula:

which breaks down in vivo to the nature identical glyceric acid. Particularly preferred are compounds derived from D-glyceric acid.

Thus preferred compounds of formula I include:

- 5'-O-[(S,R) 2,3-bis-(L-valyloxy)-propionyl]-2',3'-dideoxy-3'-fluoroguanosine,
- 5'-O-[(S,R) 2,3-bis-(L-isoleucyloxy)-propionyl]-2',3'-dideoxy-3'-fluoroguanosine,
- and most preferably
- 5'-O-[(R) 2,3-bis-(L-valyloxy)-propionyl]-2',3'-dideoxy-3'-fluoroguanosine,
- 5'-O-[(R) 2,3-bis-(L-isoleucyloxy)-propionyl]-2',3'-dideoxy-3'-fluoroguanosine;
- and their pharmaceutically acceptable salts..

A particularly preferred group of trifunctional linkers comprise glycerol derivatives of the formula IIc

- where A is hydrogen, the acyl residue of an aliphatic L-amino acid ester or the acyl residue of a fatty acid ester, A' is the acyl residue of an aliphatic amino acid residue and D is a C<sub>2</sub>-C<sub>6</sub> saturated or unsaturated dicarboxylic acid residue. Trifunctional linkers of the formula IIc are hydrolysed or otherwise break down in vivo to release the nature identical compounds glycerol, the L-amino acid, the fatty acid (if present) and the dicarboxylic acid, each of which are generally safely metabolised and/or

excreted by the body. Preferably A and A' are both residues of an aliphatic amino acid, most preferably the same residue, particularly residues of L-valine or L-isoleucine.

5 In the event that the dicarboxylic acid moiety in the derivative of formula IIc is esterified directly to the 5' hydroxy function (or equivalent) on the nucleoside, an alternative analysis would be to define the glycerol moiety as trifunctional linker L<sub>1</sub> and the dicarboxylic acid moiety as difunctional linker L<sub>2</sub>.

10 Particularly preferred dicarboxylic acid residues include those derived from oxalic, malonic, tartronic, succinic, maleic, fumaric, malic, tartaric, glutaric, glutaconic, citraconic, itaconic, ethidine-malonic, mesaconic, adipic, allylmalonic, propylidenemalonic, hydromuconic, pyrocinchonic and muconic acids and the like. The dicarboxylic acid residue may be optionally substituted, for example with the  
15 substituents listed above in respect of R<sub>1</sub> as a fatty acid. Hydroxy substituents can in turn be esterified with a further L-amino acid or fatty acid residue.

Several of the abovementioned dicarboxylic acids can themselves define a trifunctional linker. For instance hydroxy-substituted dicarboxylic acids such as  
20 tartaric acid or malic acid offer a number of configurations within the scope of the invention. Taking tartaric acid as an example a carboxyl function is available for esterification with the 5'-hydroxyl function of a nucleoside (optionally via difunctional linker L<sub>2</sub>). The hydroxy functions are available for esterification with the respective carboxyl functions of R<sub>2</sub> and an R<sub>1</sub> fatty acid or amino acid while the  
25 remaining carboxy group can be free, or optionally protected, for instance with a conventional pharmaceutically acceptable ester such as the methyl or ethyl ester. Alternatively the optional protection of the free carboxy function can itself comprise an ester with an R<sub>1</sub> fatty alcohol, with one or both hydroxyl functions being esterified to R<sub>2</sub>:

10015134-11501

Sub B3

Favoured linkers of the tartaric acid series above can be generically depicted as Formula IIe:

5

and isomers where  $\text{R}_1$  and  $\text{R}_2$  are reversed, where  $\text{R}_1$  and  $\text{R}_2$  are as shown above,  $p$ ,  $q$  and  $r$  are each independently 0 to 5, preferably 0 or 1 and  $\text{R}_y$  is the free acid, an  $\text{R}_1$  ester or a conventional pharmaceutically acceptable carboxy protecting group, such as the methyl, benzyl or especially the ethyl ester.

10

Sub B4

Favoured linkers of the malic series have the formula IIe:

IIe

where  $\text{R}_y$ ,  $p$ ,  $q$  and  $\text{R}_2$  are as defined above, preferably those where  $p$  and  $q$  are zero.

15

Preferred compounds of this aspect of the invention thus include:

5'-O-[3-methoxycarbonyl-2-valyloxy-propionyl]-2',3'-dideoxy-3'-fluoroguanosine,  
5'-O-[3-benzoyloxycarbonyl-2-valyloxy-propionyl]-2',3'-dideoxy-3'-fluoroguanosine,

5'-O-[3-methoxycarbonyl-2-isoleucyloxy-propionyl]-2',3'-dideoxy-3'-  
fluoroguanosine,

5'-O-[3-benzoyloxycarbonyl-2-isoleucyloxy-propionyl]-2',3'-dideoxy-3'-  
fluoroguanosine,

5 5'-O-[4-methoxycarbonyl-2,3-bis-valyloxy-butyryl]-2',3'-dideoxy-3'-  
fluoroguanosine,

5'-O-[4-benzoyloxycarbonyl-2,3-bis-valyloxy-butyryl]-2',3'-dideoxy-3'-  
fluoroguanosine,

10 5'-O-[4-methoxycarbonyl-2,3-bis-isoleucyloxy-butyryl]-2',3'-dideoxy-3'-  
fluoroguanosine,

5'-O-[4-benzoyloxycarbonyl-2,3-bis-isoleucyloxy-butyryl]-2',3'-dideoxy-3'-  
fluoroguanosine;

particularly those derived from L-malic acid and L-tartaric acid; and corresponding  
derivatives employing conventional pharmaceutically acceptable esters on the

15 terminal carboxy function.

Particularly favoured compounds include:

5'-O-[3-ethoxycarbonyl-2-valyloxy-propionyl]-2',3'-dideoxy-3'-fluoroguanosine,

5'-O-[3-ethoxycarbonyl-2-isoleucyloxy-propionyl]-2',3'-dideoxy-3'-

20 fluoroguanosine,

5'-O-[4-ethoxycarbonyl-2,3-bis-valyloxy-butyryl]-2',3'-dideoxy-3'-fluoroguanosine,

5'-O-[4-ethoxycarbonyl-2,3-bis-isoleucyloxy-butyryl]-2',3'-dideoxy-3'-

fluoroguanosine, especially the isomers derived from L-malic and L-tartaric acid.

25 In a related alternative aspect of the invention one of R<sub>1</sub> and R<sub>2</sub> is omitted.

Representative compounds of this aspect of the invention include those of the  
formual Ia:

where Alk is optionally substituted  $C_1$ - $C_4$  alkyl or  $C_2$  -  $C_4$  alkenyl and  $R_2$  is the ester residue of an aliphatic L-amino acid or a fatty acid as defined for  $R_1$  and  $R_2$  above.

Linkers of this aspect of the invention are conveniently prepared from  $\alpha$ -hydroxy  $\omega$ -carboxylic acids such as carbonic acid, glycollic acid, hydroxypropanoic acid, hydroxybutyric acid, hydroxyvaleric acid or hydroxycaproic acid.

Representative compounds of Formula Ia include:

- 2',3'-dideoxy-3'-fluoro-5'-O-[3-(L-valyloxy)-propionyl] guanosine
- 2',3'-dideoxy-3'-fluoro-5'-O-[5-(L-valyloxy)-pentanoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5'-O-[6-(L-valyloxy)-hexanoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5'-O-[3-(L-isoleucyloxy)-propionyl] guanosine
- 2',3'-dideoxy-3'-fluoro-5'-O-[5-(L-isoleucyloxy)-pentanoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5'-O-[6-(L-isoleucyloxy)-hexanoyl] guanosine,
- and pharmaceutically acceptable salts thereof.

Particularly favoured compounds of formula Ia include:

- 2',3'-dideoxy-3'-fluoro-5'-O-[4-(L-valyloxy)-butyryl] guanosine; and
- 2',3'-dideoxy-3'-fluoro-5'-O-[4-(L-isoleucyloxy)-butyryl] guanosine and
- pharmaceutically acceptable salts thereof. In these compounds hydrolysis and removal of the  $R_2$  group in vivo leaves a reactive terminal radical which will tend to cyclize and prompt the effective release of the mother nucleoside.

In a related alternative aspect of the invention,  $R_1$  as a fatty acid residue is itself used as the linker, with the aliphatic L-amino acid residue of  $R_2$  being esterified/amide bonded to an amino, hydroxy or carboxy function on the fatty acid alkyl chain, for

Sub B5  
 example on the  $\beta$ -carbon. In this embodiment the fatty acid of  $R_1$  is esterified directly on the 5'-hydroxy (or equivalent) function of the nucleoside, generally with the  $R_2$  group already esterified/amide bonded thereon. Alternatively, the functionalised fatty acid (the carboxy/hydroxy/amino function being appropriately protected) can be first esterified to the nucleoside and deprotected prior to coupling with  $R_2$ . Linkers in accordance with a preferred embodiment of this aspect have the formula IIId:

where  $R_2$  is the residue of an aliphatic L-amino acid and, p is 0, 1 or 2-20 (optionally including a double bond) and q is 0-5, preferably 0. Representative compounds include:

- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-valyloxy)-butyryl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-valyloxy)-hexanoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-valyloxy)-octanoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-valyloxy)-decanoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-valyloxy)-dodecanoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-valyloxy)-myristoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-valyloxy)-palmitoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-valyloxy)-stearoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-valyloxy)-docosanoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-valyloxy)-eicosanoyl] guanosine
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-isoleucyloxy)-butyryl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-isoleucyloxy)-hexanoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-isoleucyloxy)-octanoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-isoleucyloxy)-decanoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-isoleucyloxy)-dodecanoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-isoleucyloxy)-myristoyl] guanosine,
- 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-isoleucyloxy)-palmitoyl] guanosine,

2',3'-dideoxy-3'-fluoro-5-O-[2-(L-isoleucyloxy)-stearoyl] guanosine,  
 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-isoleucyloxy)-docosanoyl] guanosine,  
 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-isoleucyloxy)-eicosanoyl] guanosine,  
 and the corresponding n-3 and n-6 monounsaturated analogues, such as 6 or 9  
 5 octadecenoyl derivatives.

In formula IIId, p and q are preferably 0, thus defining lactic acid derivatives,  
 preferably L-lactic acid derivatives, such as

2',3'-dideoxy-3'-fluoro-5-O-[2-(L-valyloxy)-propionyl] guanosine; and  
 10 2',3'-dideoxy-3'-fluoro-5-O-[2-(L-isoleucyloxy)-propionyl] guanosine and  
 pharmaceutically acceptable salts thereof, as the breakdown products, lactic acid and  
 the amino acid are both well accepted physiologically.

The expression bifunctional in the context of second linker group L<sub>2</sub> means that the  
 15 the linker has two functions enabling it to act a spacer or bridge between the first  
 linker group L<sub>1</sub> and the 5'-O group of the nucleoside. For instance the optional group  
 L<sub>2</sub> may comprise a linker of the formula IIIa:

IIIa

where R<sub>4</sub> and R<sub>4</sub>' are hydrogen or C<sub>1</sub>-C<sub>4</sub> alkyl. In formula IIIa, R<sub>4</sub> is preferably  
 20 hydrogen, methyl, ethyl or isopropyl and R<sub>4</sub>' is hydrogen. Linkers of formula IIIa are  
 convenient as many nucleosides such as the FLG mother compound must first be  
 phosphorylated by cellular enzymes before it can inhibit the viral polymerase. An  
 initial or sequential hydrolysis of compounds of the invention can release a  
 monophosphorylated nucleoside in vivo which is available for immediate conversion  
 25 to the di- and triphosphate.

Alternatively the optional bifunctional linker group L<sub>2</sub> may comprise a structure of  
 the formula IIIb:

where  $R_4$  and  $R_{4'}$  are independently H or  $C_1$ - $C_4$  alkyl.

5

A still further group of bifunctional linkers have the formula IIIc:

As described above, a preferred group of bifunctional linkers comprises  $\alpha,\omega$ -dicarboxylic  $C_2$ - $C_6$  alkyl derivatives, such as succinic acid, which are optionally substituted (for instance with the substituents defined above for  $R_1$  as a fatty acid) and/or optionally mono or polyunsaturated, such as n-3 or n-6 monounsaturated. Preferred moieties within this class are listed above.

Although the disclosure above has concentrated on glycerol  $L_1$  groups in conjunction with dicarboxylic  $L_2$  groups, it will be appreciated that a wide variety of trifunctional linkers are appropriate with dicarboxylic  $L_2$  groups, for instance structures of the formula IIa and IIb above lacking the rightmost carbonyl.

The invention further includes double prodrugs comprising  $R_1(R_2)$   $L_1L_2$ -derivatives of conventional FLG prodrugs, which conventional prodrugs release FLG in vivo, such as prodrug derivatives at the 2 and 6 positions of the FLG guanine base. Examples of such conventional FLG-prodrugs include compounds of the formula IV:

10015184.111601

where  $R_1$ ,  $R_2$ ,  $L_1$  and  $L_2$  are as defined above; and

$R_3$  is H, N<sub>3</sub>, NH<sub>2</sub>, or OH or a pharmaceutically acceptable ether or ester thereof; and  $R_3'$  is an aromatic bond or hydrogen;

5

Potential pharmaceutically acceptable esters for  $R_3$  include the fatty acids described in relation to  $R_1$  above, such as stearoyl, oleoyl etc or shorter esters such as acetyl or butyryl. Other potential esters include the amino acid derivatives of  $R_2$  or esters of phosphoric acid, such as monophosphate. Alternative esters include the

10 corresponding fatty acid or alkylaryl carbonate, carbamate or sulphonic esters.

Suitable pharmaceutically acceptable ethers for  $R_3$  include C<sub>1</sub>-C<sub>6</sub> alkyl, cycloalkyl, C<sub>6</sub>-C<sub>12</sub> alkaryl such as benzyl or methylpyridyl, any of which may be optionally substituted as for  $R_1$  above. Convenient ethers include those described in the

15 abovementioned WO 93 13778 such as n-propoxy, cyclobutoxy, cyclopropylamino, piperidino or pyrrolidino and the like.

The invention has thus far been described with reference to the monohydroxylated nucleoside FLG, however it will be apparent that corresponding derivatives can be

20 prepared of other monohydroxylated nucleoside analogues, particularly those where the monohydroxy group corresponds to the 5' hydroxy function of a nucleoside. Thus an additional aspect of the invention provides compounds of the formula Ic:

Ic

where  $R_1$ ,  $R_2$ ,  $L_1$  and  $L_2$  are as defined above and - O-nuc is the residue of a monohydroxyl bearing D- or L-nucleoside analogue. Representative nucleosides in accordance with this aspect of the invention include acyclic nucleoside analogues such as acyclovir and cyclic nucleoside analogues such as ddI (didanosine), ddC (zalcitabine), d4T (stavudine), FTC, lamivudine (3TC), 1592U89 (4-[2-amino-6-(cyclopropylamino)-9H-purin-9-yl]-2-cyclopentene-1-methanol), AZT (zidovudine), DAPD (D-2,6-diaminopurine dioxolane), F-ddA and the like, each of which are well known in the nucleoside art. A number of monohydric L-nucleosides are under development and the invention will also find utility on this compounds. Compounds within this aspect of the invention will find utility in the corresponding indications to the mother compounds, for instance herpesvirus infections for acyclovir derivatives, HIV for ddI, stavudine, ddC, lamivudine, AZT & 1592U89, HBV for lamivudine, FTC etc.

A favoured subgroup within Formula Ic comprises derivatives of monohydric nucleosides of the formula Ic':

Ic'

where A, A', Alk and O-nuc are as defined above. Formula Ic' above depicts compounds wherein A and A' depend from the 1 and 3 positions of the glycereol moiety and  $L_2$  depends from the glycerol 2 position. In alternative isomers A and A' depend 1 and 2 or 2 and 3 and  $L_2$  from 3 or 2 respectively.

Representative compounds within this aspect of the invention include :  
4'-O-[3-((2,3-bis-L-valyloxy)-1-propyloxycarbonyl)propionyl] acyclovir,

- 4'-O-[3-((2-hydroxy-3-L-valyloxy)-1-propyloxycarbonyl)propionyl] acyclovir,  
4'-O-[3-((2,3-bis-L-isoleucyloxy)-1-propyloxycarbonyl)propionyl] acyclovir,  
4'-O-[3-((2-hydroxy-3-L-isoleucyloxy)-1-propyloxycarbonyl)propionyl] acyclovir,  
4'-O-[3-((1,3-bis-L-valyloxy)-2-propyloxycarbonyl)propionyl] acyclovir,  
5 4'-O-[3-((1-hydroxy-3-L-valyloxy)-2-propyloxycarbonyl)propionyl] acyclovir,  
4'-O-[3-((1,3-bis-L-isoleucyloxy)-2-propyloxycarbonyl)propionyl] acyclovir,

and the corresponding derivatives of 4-[2-amino-6(cyclopropylamino)-9H-purin-9-yl]-2-cyclopentene-1-methanol; and pharmaceutically acceptable salts thereof.

The breakdown products of such compounds, lactic acid and the amino acid, are both well accepted physiologically.

The compounds of the invention can form salts which form an additional aspect of the invention. Appropriate pharmaceutically acceptable salts of the compounds of Formula I include salts of organic acids, especially carboxylic acids, including but not limited to acetate, trifluoroacetate, lactate, gluconate, citrate, tartrate, maleate, malate, pantothenate, isethionate, adipate, alginate, aspartate, benzoate, butyrate, digluconate, cyclopentanoate, glucoheptanoate, glycerophosphate, oxalate, heptanoate, hexanoate, fumarate, nicotinate, palmoate, pectinate, 3-phenylpropionate, picrate,

pivalate, propionate, tartrate, lactobionate, pivalate, camphorate, undecanoate and succinate, organic sulphonic acids such as methanesulphonate, ethanesulphonate, 2-hydroxyethane sulphonate, camphorsulphonat , 2-naphthalenesulphonate, benzenesulphonate, p-chlorobenzenesulphonate and p-toluenesulphonate; and  
5 inorganic acids such as hydrochloride, hydrobromide, hydroiodide, sulphate, bisulphate, hemisulphate, thiocyanate, persulphate, phosphoric and sulphonic acids. The compounds of Formula I may in some cases be isolated as the hydrate.

10 The term "N-protecting group" or "N-protected" as used herein refers to those groups intended to protect the N-terminus of an amino acid or peptide or to protect an amino group against undesirable reactions during synthetic procedures. Commonly used N-protecting groups are disclosed in Greene, "Protective Groups in Organic Synthesis" (John Wiley & Sons, New York, 1981), which is hereby incorporated by reference. N-protecting groups include acyl groups such as formyl, acetyl, propionyl, pivaloyl,  
15 t-butylacetyl, 2-chloroacetyl, 2-bromoacetyl, trifluoroacetyl, trichloroacetyl, phthalyl, o-nitrophenoxycetyl,  $\alpha$ -chlorobutyryl, benzoyl, 4-chlorobenzoyl, 4-bromobenzoyl, 4-nitrobenzoyl, and the like; sulfonyl groups such as benzenesulfonyl, p-toluenesulfonyl, and the like, carbamate forming groups such as benzyloxycarbonyl, p-chlorobenzyloxycarbonyl, p-methoxybenzyloxycarbonyl,  
20 p-nitrobenzyloxycarbonyl, 2-nitrobenzyloxycarbonyl, p-bromobenzyloxycarbonyl, 3,4-dimethoxybenzyloxycarbonyl, 4-methoxybenzyloxycarbonyl, 2-nitro-4,5-dimethoxybenzyloxycarbonyl, 3,4,5-trimethoxybenzyloxycarbonyl, 1-(p-biphenyl)-1-methylethoxycarbonyl,  $\alpha,\alpha$ -dimethyl-3,5-dimethoxybenzyloxycarbonyl, benzhydryloxycarbonyl, t-butoxycarbonyl,  
25 diisopropylmethoxycarbonyl, isopropylloxycarbonyl, ethoxycarbonyl, methoxycarbonyl, allyloxycarbonyl, 2,2,2-trichloroethoxycarbonyl, phenoxycarbonyl, 4-nitrophenoxycarbonyl, fluorenyl-9-methoxycarbonyl, cyclopentylloxycarbonyl, adamantylloxycarbonyl, cyclohexylloxycarbonyl, phenylthiocarbonyl, and the like; alkyl groups such as benzyl, triphenylmethyl,  
30 benzyloxymethyl and the like; and silyl groups such as trimethylsilyl and the like. Favoured N-protecting groups include formyl, acetyl, allyl, F-moc, benzoyl, pivaloyl, t-butylacetyl, phenylsulfonyl, benzyl, t-butoxycarbonyl (BOC) and benzyloxycarbonyl (Cbz).

1005184-11601

Hydroxy and/or carboxy protecting groups are also extensively reviewed in Greene  
ibid and include ethers such as methyl, substituted methyl ethers such as  
methoxymethyl, methylthiomethyl, benzyloxymethyl, t-butoxymethyl, 2-  
5 methoxyethoxymethyl and the like, silyl ethers such as trimethylsilyl (TMS), t-  
butyldimethylsilyl (TBDMS) tribenzylsilyl, triphenylsilyl, t-butyldiphenylsilyl  
triisopropyl silyl and the like, substituted ethyl ethers such as 1-ethoxymethyl, 1-  
methyl-1-methoxyethyl, t-butyl, allyl, benzyl, p-methoxybenzyl, diphenylmethyl,  
triphenylmethyl and the like, aralkyl groups such as trityl, and pixyl (9-hydroxy-9-  
10 phenylxanthene derivatives, especially the chloride). Ester hydroxy protecting groups  
include esters such as formate, benzylformate, chloroacetate, methoxyacetate,  
phenoxyacetate, pivaloate, adamantate, mesitoate, benzoate and the like. Carbonate  
hydroxy protecting groups include methyl vinyl, allyl, cinnamyl, benzyl and the like.

15 In keeping with the usual practice with retroviral and HBV inhibitors it is  
advantageous to co-administer one to three or more additional antivirals, such as  
AZT, ddI, ddC, d4T, 3TC, H2G, foscarnet, ritonavir, indinavir, saquinavir,  
nevirapine, delaviridine, Vertex VX 478 or Agouron AG1343 and the like in the case  
of HIV or lamivudine, interferon, famciclovir etc in the case of HBV. Such  
20 additional antivirals will normally be administered at dosages relative to each other  
which broadly reflect their respective therapeutic values. Molar ratios of 100:1 to  
1:100, especially 25:1 to 1:25, relative to the compound or salt of formula I will often  
be convenient. Administration of additional antivirals is generally less common with  
those antiviral nucleosides intended for treating herpes infections.

25

While it is possible for the active agent to be administered alone, it is preferable to  
present it as part of a pharmaceutical formulation. Such a formulation will comprise  
the above defined active agent together with one or more acceptable  
carriers/excipients and optionally other therapeutic ingredients. The carrier(s) must

10015134-111601

be acceptable in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient.

The formulations include those suitable for rectal, nasal, topical (including buccal and sublingual), vaginal or parenteral (including subcutaneous, intramuscular, intravenous and intradermal) administration, but preferably the formulation is an orally administered formulation. The formulations may conveniently be presented in unit dosage form, e.g. tablets and sustained release capsules, and may be prepared by any methods well known in the art of pharmacy.

Such methods include the step of bringing into association the above defined active agent with the carrier. In general, the formulations are prepared by uniformly and intimately bringing into association the active agent with liquid carriers or finely divided solid carriers or both, and then if necessary shaping the product. The invention extends to methods for preparing a pharmaceutical composition comprising bringing a compound of Formula I or its pharmaceutically acceptable salt in conjunction or association with a pharmaceutically acceptable carrier or vehicle. If the manufacture of pharmaceutical formulations involves intimate mixing of pharmaceutical excipients and the active ingredient in salt form, then it is often preferred to use excipients which are non-basic in nature, i.e. either acidic or neutral.

Formulations for oral administration in the present invention may be presented as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active agent; as a powder or granules; as a solution or a suspension of the active agent in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water in oil liquid emulsion and as a bolus etc.

With regard to compositions for oral administration (e.g. tablets and capsules), the term suitable carrier includes vehicles such as common excipients e.g. binding agents, for example syrup, acacia, gelatin, sorbitol, tragacanth, polyvinylpyrrolidone (Povidone), methylcellulose, ethylcellulose, sodium carboxymethylcellulose, hydroxypropylmethylcellulose, sucrose and starch; fillers and carriers, for example corn starch, gelatin, lactose, sucrose, microcrystalline cellulose, kaolin, mannitol, dicalcium phosphate, sodium chloride and alginic acid; and lubricants such as magnesium stearate, sodium stearate and other metallic stearates, glycerol stearate stearic acid, silicone fluid, talc waxes, oils and colloidal silica. Flavouring agents such as peppermint, oil of wintergreen, cherry flavouring or the like can also be used. It may be desirable to add a colouring agent to make the dosage form readily identifiable. Tablets may also be coated by methods well known in the art.

A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active agent in a free flowing form such as a powder or granules, optionally mixed with a binder, lubricant, inert diluent, preservative, surface-active or dispersing agent. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may be optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active agent.

Other formulations suitable for oral administration include lozenges comprising the active agent in a flavoured base, usually sucrose and acacia or tragacanth; pastilles comprising the active agent in an inert base such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the active agent in a suitable liquid carrier.

10015134-111601

A still further aspect of the invention provides a method for the preparation of a compound of Formula I or Ic comprising the acylation of the nucleoside, represented here by FLG, Formula V, typically at the 5' hydroxy group:

5 in which  $R_1(R_2)L_1X$  represents an activated acid, such as the carboxylic derivatives of Formula IIa or IIb, where  $R_1$ ,  $R_2$ , and  $L_1$  are as defined above or protected derivatives thereof. Alternatively the activated acid may comprise a compound of the formula  $R_1(R_2)$ glycerol-D-X, where  $R_1$ ,  $R_2$  and D are as defined in formula IIc or an activated  $R_z-O-Alk-C(=O)X$  derivative in the case of compounds of formula Ia. In the latter  
10 cases the linkers may be built up sequentially by first esterifying a suitably protected D or  $\omega$ -hydroxy carboxylic acid to the nucleoside, deprotecting the terminal carboxy or hydroxy function and esterifying the suitably protected glycerol or  $R_z$  moiety thereon.

15 The activated derivative used in the acylation may comprise e.g., the acid halide, acid anhydride, activated acid ester or the acid in the presence of coupling reagent, for example dicyclohexylcarbodiimide. Representative activated acid derivatives include the acid chloride, anhydrides derived from alkoxycarbonyl halides such as isobutyloxycarbonylchloride and the like, N-hydroxysuccinamide derived esters,  
20 N-hydroxyphthalimide derived esters, N-hydroxy-5-norbornene-2,3-dicarboxamide derived esters, 2,4,5-trichlorophenol derived esters and the like. Further activated acids include those where X in the formula  $RX$  represents an  $OR'$  moiety where R is  $R_2$  as defined herein, and  $R'$  is, for example  $COCH_3$ ,  $COCH_2CH_3$  or  $COCF_3$ , or where X is benzotriazole.

25

Corresponding methodology will be applicable when the invention is applied to other monohydroxylated nucleosides, that is the activated derivative is

correspondingly esterified to the free 5' hydroxy (or equivalent) of monohydric nucleosides such as acyclovir, ddI, FTC, lamivudine, 1592U89, DAPD, F-ddA and the like.

- 5 The intermediates used in the above methods themselves define novel compounds, especially those of the formula: IIc'

- 10 where A, A' and Alk are as defined above (A and A' being optionally protected with conventional protecting groups) and X represents the free acid or an activated acid as illustrated above.

Corresponding compounds to those of formula IIc' include:

IIa'

- where R<sub>x</sub>, Alk, m, n and T are as described above, A and A' represent acyl  
 residues of L'-aliphatic amino acids (N-protected as necessary) esterified to  
 hydroxy functions on the linker or one of A and A' is the acyl residue and the  
 20 other is a free hydroxy group, and X represents the free acid or an activated  
 acid as illustrated above. Preferably A and A' are the same amino acid residue.

Other novel intermediates include the free or activated acid precursors of  
 compounds of the formula Ia such as:

- 25 3-N-Boc-L-valyloxypropanoic acid, 3-N-Fmoc-L-valyloxypropanoic acid, 3-N-

4-benzyloxycarbonyl-2,3-bis-valyloxy-butyric acid

4-benzyloxycarbonyl-2,3-bis-isoleucyloxy-butyric acid, and the like;

the corresponding compounds wherein the amino acid is N-protected,  
particularly with a protecting group allowing selective deprotection of the N-  
protective group without removal of the carboxy protecting group; and the  
corresponding activated derivatives such as the acid halides.

Still further novel intermediates include precursors corresponding to structure  
II d, such as;

2-(L-valyloxy)propanoic acid, 2-(N-Boc-L-valyloxy)propanoic acid, 2-(N-  
Fmoc-L-valyloxy)propanoic acid, 2-(N-CBZ-L-valyloxy)propanoic acid, 2-(L-

isoleucyloxy)butyric acid, N-(CBZ-L-isoleucyloxy)butyric acid, and the like; and activated derivatives thereof, such as the acid halides.

Preparation of 3' fluoronucleosides such as those of formula V has been  
5 extensively reviewed by Herdiwijn et al. in Nucleosides and Nucleotides 8 (1)  
65-96 (1989), which is hereby incorporated by reference. The preparation of  
other monohydric nucleosides such as acyclovir, ddI (didanosine), ddC  
(zalcitabine), d4T (stavudine), FTC, lamivudine (3TC), 1592U89 (4-[2-amino-  
6-(cyclopropylamino)-9H-purin-9-yl]-2-cyclopentene-1-methanol), AZT  
10 (zidovudine), DAPD (D-2,6-diaminopurine dioxolane), F-ddA and the like are  
well known and extensively described in the literature.

The reactive derivatives of the  $R_1(R_2)L_1L_2X$  group may be pre-formed or  
generated in situ by the use of reagents such as dicyclohexylcarbodiimide  
15 (DCC) or O-(1H-benzotriazol-1-yl) N,N,N',N'-tetramethyluronium  
tetrafluoroborate (TBTU). When an acid halide, such as the acid chloride is  
used, a tertiary amine catalyst, such as triethylamine, N,N'-dimethylaniline,  
pyridine or dimethylaminopyridine may be added to the reaction mixture to  
bind the liberated hydrohalic acid.

20 The reactions are preferably carried out in an unreactive solvent such as N,N-  
dimethylformamide, tetrahydrofuran, dioxane, acetonitrile or a halogenated  
hydrocarbon, such as dichloromethane. If desired, any of the above mentioned  
tertiary amine catalysts may be used as solvent, taking care that a suitable  
25 excess is present. The reaction temperature can typically be varied between 0°  
C and 60° C, but will preferably be kept between 5° and 50° C. After a period  
of 1 to 60 hours the reaction will usually be essentially complete. The progress  
of the reaction can be followed using thin layer chromatography (TLC) and  
appropriate solvent systems. In general, when the reaction is completed as  
30 determined by TLC, the product is extracted with an organic solvent and  
purified by chromatography and/or recrystallisation from an appropriate  
solvent system.

10045184-111501

By-products where acylation has taken place on the nucleoside base can be separated by chromatography, but such misacylation can be minimized by controlled reaction conditions. These controlled conditions can be achieved, for example, by manipulating the reagent concentrations or rate of addition, especially of the acylating agent, by lowering the temperature or by the choice of solvent. The reaction can be followed by TLC to monitor the controlled conditions. It may be convenient to protect the 6-oxo group on the base and especially the 2 amino with conventional protecting groups to forestall misacylation.

Compounds of Formula IV in which  $R_1$  is hydrogen may be prepared by 6-activating the corresponding guanine compound of Formula I (wherein the exposed amino function of the amino acid residue of  $R_2$  is optionally protected with conventional N-protecting groups) with an activating group such as halo. The thus activated 6-purine is subsequently reduced to purine, for instance with a palladium or nickel catalyst and deprotected to the desired compound of Formula IV or Formula V.

Compounds wherein  $R_1$  is an  $R_1$  or other ester may be prepared by conventional esterification (analogous to the esterification described above) of the corresponding hydroxy compound of Formula I or Formula V, optionally after conventional N-protecting the exposed amine function of the amino acid residue of  $R_2$  and/or  $R_3$ . Compounds wherein  $R_3$  is an ether may be prepared analogously to the process disclosed in the abovementioned WO 93 13778, again in conjunction with optional N-protection of exposed amine groups. Compounds wherein  $R_3$  is an azide can be prepared as described in WO 97 09052.

Intermediates of the formula IIc are conveniently prepared by acylation of a carboxy-protected hydroxy alkanoic acid, typically a 2-hydroxy-1-alkanoic acid, with the appropriate activated and N-protected  $R_2$  derivative, such as N-CBZ valyl or isoleucyl in conjunction with a conventional coupling reagent

such as DMAP/DCC or with the amino acid halide. The carboxy protecting group is then removed, for instance by acid hydrolysis and the resulting intermediate is activated as described above or the free acid is used in conjunction with a coupling reagent to esterify the nucleoside under conventional esterification conditions.

Compounds within the scope of the invention are also conveniently prepared by the methodology in the immediately preceding paragraph, namely esterification of a carboxy protected  $\alpha$ -hydroxy,  $\omega$ -carboxy acid, such as glycollic acid, lactic acid, hydroxybutyric acid etc with the appropriate N-protected  $R_2$  derivative, either as the free acid in conjunction with a coupling agent or activated, for instance to the corresponding acid halide. The carboxy protecting group is removed and the resulting intermediate esterified with the nucleoside with the methodology described above.

Compounds comprising a structure of the formula IIe or II f are prepared by carboxy protecting the terminal carboxy groups of the respective dicarboxylic acid, such as L-tartaric acid or L-malic acid, with conventional carboxy protecting groups such as benzyl. The free hydroxy group (s) are then esterified with conventional esterification techniques, such as DMAP & DCC in DMF with the appropriate N-protected  $R_2$  amino acid, such as N-Boc-L-valyl or N-Boc-L-isoleucyl. The benzyl carboxy protecting groups are removed and the resulting product is esterified to the 5'-hydroxy function of a monohydric nucleoside, using conventional conditions, such as those in the accompanying Examples. Finally, the free carboxy function is esterified with an  $R_1$  group or, more preferably a conventional pharmaceutically acceptable ester, such as the ethyl ester.

Compounds comprising a phosphorylated moiety III may be prepared by reacting 2',3'-dideoxy-3'-fluoroguanine-5-monophosphate with a compound of Formula VIa

where Ha is halo, such as chloro, iodo or bromo, in analagous conditions to those described in US 4 337 201, US 5 227 506, WO 94/13682 & WO 94/13324, Starret et al J Med Chem 37 1857-1864 (1994) and Iyer et al Tetrahedron Lett 30 7141-7144 (1989) which are incorporated herein by reference. The monophosphate can be prepared by conventional phosphorylation of FLG, as described, for instance, in Herdwyn et al ibid. Corresponding methodology will apply to the monophosphates of other monohydric nucleosides.

- Compounds comprising an optional linker  $L_2$  may also be prepared by a two stage process. In particular a compound of the formula  $\text{ClC}(=\text{O})\text{OC}(\text{R}_4)(\text{R}_4')\text{Cl}$  can be reacted with the 5'-hydroxy of FLG (optionally protected on the base with conventional protecting groups) as is known in the cephalosporin art. The resulting  $\text{FLG-5'-O-C}(=\text{O})\text{OC}(\text{R}_4)(\text{R}_4')\text{chloride}$  is then reacted with an  $\text{R}_1$  and  $\text{R}_2$  bearing trifunctional linker wherein the third function comprises a carboxyl function, such as the potassium salt.

It will be appreciated that trifunctional  $L_1$  groups of formula IIa wherein  $n$  and  $m$  are 1 and Alk is absent can be prepared from glycerol by regioselective esterification as depicted below in scheme 1 by reference to a stearyl/L-valyl combination. In short  $\text{R}_1$  and  $\text{R}_2$  are regioselectively esterified to positions 1 and 3 of the glycerol and position 2 is then converted to the appropriate  $-\text{T-C}(=\text{O})-$  group, which is then esterified to the 5'-position of the fluoronucleoside or to a cooperating function on  $L_2$  (not depicted). Alternatively the hydroxy at position 2 of the glycerol derivative can be esterified with an  $L_2$  group containing a cooperating carbonyl function on its left hand end.

$L_1$  groups of formula IIa wherein  $m$  is 1,  $n$  is 0 and Alk is methylene can also be prepared from glycerol by regioselectively esterifying  $\text{R}_1$  and  $\text{R}_2$  to positions 1 and 2 of the glycerol, as also depicted below in scheme 1, followed by conversion of the

hydroxy at position 3 to the appropriate -T-C(=O)-group. The leftmost series of reactions on Scheme 1 shows the situation where R<sub>1</sub> is esterified to position 1 of the glycerol and R<sub>2</sub> is esterified to position 2. The corresponding arrangement where R<sub>1</sub> is esterified to position 2 and R<sub>2</sub> to position 1 can be achieved by first treating the glycerol with CBz-L-valine/DCC/DMAP/DMF and then protecting the 3 position with pixyl chloride prior to esterifying the fatty acid of R<sub>1</sub> to position 2 of the glycerol, deprotecting and converting the 3 position as necessary.

## SCHEME I

- Although Scheme 1 has been illustrated by reference to a combination wherein  $R_1$  is stearoyl and  $R_2$  is L-valyl, it will be appreciated that this basic scheme will also be applicable to other amino acids, where present other fatty acids, or using conventional protection groups, to combinations of  $R_2$  as an amino acid derivative and  $R_1$  as hydroxy. Linkers where T comprises an -NH- group can be prepared by analogous regioselective esterification followed by conversion of the free hydroxyl to amine, reduction to azide and reaction with phosgene to form the corresponding chlorocarbamate.
- 10 A variation of scheme I allowing the preparation of linkers of the formula IIc. In this variation, the phosgene step shown above is replaced by reaction with an activated dicarboxylic acid, such as succinic anhydride. This results in a glycerol triester (comprising the (optionally protected)  $R_1$  ester, the protected  $R_2$  ester and the ester of the dicarboxylic acid) and the free carboxy on the dicarboxylic acid is then activated and esterified to the nucleoside in a conventional fashion. Alternatively linkers of formula IIc can be built up in situ on the nucleoside. In this variant, the dicarboxylic acid is esterified to a suitably protected glycerol derivative. This succinyl monoester is then esterified to the 5'-hydroxy function of the nucleoside in a conventional manner. Finally one or both of the protecting groups on the glycerol moiety is replaced with the L-amino acid ester, and, if present, the remaining protecting group is replaced with a fatty acid ester or removed to leave a free hydroxy group. This is depicted in Scheme 1A which illustrates an example wherein the nucleoside in acyclovir (FLG shown in shadow), the dicarboxylic acid is succinyl and  $R_1$  and  $R_2$  are both CBZ-protected valyl, but will, of course be applicable to other variations of Formula Ic. In each case coupling conditions means standard esterification conditions such as coupling reagents DMAP, DCC etc or alternatively conversion of the relevant carboxy function to an activated derivative such as the acid chloride or the activated succinic moiety can also comprise the anhydride.

## SCHEME IA

- In a variation of Scheme IA, the succinic anhydride is reacted directly with the nucleoside, thus avoiding the first protection and deprotection steps. A further
- 5 alternative is to regioselectively esterify the glycerol moiety with the N-protected amino acid moiety(ies), generally in conjunction with protection of the hydroxy function intended for coupling to the nucleoside, followed by deprotection of that hydroxy and coupling to the nucleoside.

## SCHEME II

Linkers where m and n are 1, Alk is alkylene or alkenylene and T is a bond can be prepared as shown in Scheme II above. Other permutations of m, n, Alk and the

various functions in the trifunctional linker group  $L_1$  of formula IIa can be prepared analogously to the above with the corresponding starter materials, such as 1,2,4-trihydroxybutane (CA registry number 3968-00-6), 3,4-dihydroxybutanoic acid (1518-61-2 & 22329-74-4), (S)-3,4-dihydroxybutanoic acid (51267-44-8), (R)-3,4-dihydroxybutanoic acid (158800-76-1), 1,2,5-pentanetriol (51064-73-4 & 14697-46-2), (S)-1,2,5-pentanetriol (13942-73-9), (R)-1,2,5-pentanetriol (171335-70-9), 4,5-dihydroxypentanoic acid (66679-29-6 & 129725-14-0), 1,3,5-pentanetriol (4328-94-3) and 3-(2-hydroxyethyl)-1,5-pentanediol (53378-75-9). The preparation of each of these starting materials is described in the references to the respective registry number. Ohsawa et al in Chem Pharm Bull 41 (11) 1906-1909 (1993) and Terao et al Chem. Pharm. Bull. 39(3) 823-825 (1991) describe the control of the stereochemistry of trifunctional linker groups with lipase P.

The amino acid derivative of  $R_2$  and, if present,  $R_1$  can alternatively be esterified to the linker group with the 2-oxa-4-aza-cycloalkane-1,3-dione methodology described in international patent application no. WO 94/29311, the contents of which are hereby incorporated by reference.

Linking of the carboxy function of  $R_1$  and/or  $R_2$  to an amine group on the linker derivative proceeds by conventional peptide chemistry, generally in conjunction with protection of the  $\alpha$ -amine with conventional N-protecting groups. Formation of an amide bond between a carboxyl function on the linker and the  $\alpha$ -amine group of  $R_2$  also proceeds by conventional peptide chemistry, generally in conjunction with protection of the  $\alpha$ -carboxy function. Esterification of  $R_1$  as a fatty alcohol to a carboxy function on the linker proceeds analogously, but conversely, to the above esterification of  $R_1$  as a fatty acid.

The above description has centred around monohydric nucleosides derivatised with a linker group which in turn is derivatised with an ester residue of an aliphatic amino acid, and, optionally, the acyl residue of a fatty acid.

In a further aspect of the invention, however, said linker group and derivatised aliphatic amino acid ester, but this time without the optional fatty ester, can be

applied to a broader range of drugs. Thus the invention further provides compounds of the formula  $D-L^*-R_2$  where  $R_2$  is the amide or ester residue of an aliphatic amino acid, D is a drug residue bearing an accesible function such as an amine, hydroxy, carboxy, phosphonate, phosphinate or phosphoryl function and L is an at least  
5 bifunctional linker comprising a first function bound to said accessible function spaced from a second function forming an amide or acyl bond with the aliphatic amino acid.

The prodrugs of this aspect of the invention are distinct from those described in  
10 WO98/21233 in that the latter comprise an obligatory fatty acid ester.

Drug residue as used in its conventional significance, that is implying that during linkage a hydrogen or hydroxy has been eliminated from an accessible amino, phosphoryl, phosphinyl, phosphonyl, carboxy or hydroxy function on the Drug. The  
15 amine function on the Drug can be a primary amine ( $-NH_2$ ) or a secondary amine ( $-NH-$ ). The amino acid of  $R_2$  may be optionally N-protected in those configurations where it possesses a free amine function.

The expression difunctional in the context of the linker group L means that the linker  
20 has at least one hydroxy or amine function available for esterification or amide bonding with  $R_2$ , or a carboxyl function available for amide bonding with the free  $\alpha$ -amine function of  $R_2$ . Spaced therefrom on the difunctional linker is a further functional group for linkage to a cooperating function on the Drug such as hydroxy, carboxy, phosphonyl, phosphoryl, phosphinyl and the like.

25 The linker may in fact be trifunctional, that is the linker has at least three functions including two independently selected from hydroxy, amine or carboxy, the amine and hydroxy function(s) being available for esterification/amide bonding with the carboxyl functions of a pair of  $R_2$ , or the carboxy function(s) on the linker being  
30 available for amide bonding with the free  $\alpha$ -amine function of  $R_2$ . These hydroxy/amine/carboxy functions are spaced from a further functional group for linkage with a cooperating function on the drug, such as hydroxy, carboxy, phosphonyl, phosphoryl, phosphinyl, amine etc. Other trifunctional linker groups

may comprise a first hydroxy, amine or carboxy function cooperating with  $R_2$ , a function cooperating with the drug and a further functional group either underivatised such as hydroxy, carboxy, amine etc or alternatively protected with conventional pharmaceutically acceptable protecting groups.

5

The invention further provides pharmaceutical compositions comprising the compounds of the present broader aspect of the invention and pharmaceutically acceptable carriers or diluents therefor. Additional aspects of the invention provide methods of medical treatment or prophylaxis comprising the administration of a compound of the invention to a human or animal suffering from or prone to the ailment to which the respective Drug is applicable.

10

By the use of the invention the pharmacokinetics of a broad range of orally administered drugs are enhanced, for instance by improving absolute bioavailability or by providing a more even release of the mother compound or by providing for a reduced interpersonal spread in pharmacokinetic performance. However the compounds of the invention are not limited to those based on orally administered drugs as the prodrugs of the invention, when parenterally administered, provide enhanced pharmacokinetic performance, for instance by improving solubility, while still allowing for efficient release of the mother compound.

15

20

Linker as used in this second aspect of the invention specifically embraces each and every linker described above in relation to the monohydric nucleoside aspect of the invention (to the extent that these omit a fatty acid ester), including the structures  $>L_1L_2$  and structures of the formulae IIa, IIb, IIc, IId, IIe, IIe, IIe, IIIa, IIIb, IIIc, (optionally protected) tartaric and malic acid linkers, and linkers depicted in formulae I, Ia, Ic, Ic', Id, If and Ig. However it will be apparent that these linker structures are of wider applicability than the monohydric nucleosides there described.

In drugs comprising multiple phosphoryl/phosphonate/phosphinate functions, it is generally advantageous that an hydroxy group on each phosphorous moiety is esterified with a structure of Formula II'e or II''b etc. Regioselective protecting groups which bridge the phosphate groups of bis phosphonates and thus assist mono and diacylation include Si compounds such as dichlorotetraisopropyldisiloxane.

15

Methodology for the derivatisation of phosphorous containing compounds with acyloxyalkyl groups and which can be used analogously for the coupling of the difunctional and trifunctional linkers of the invention is described in US patent 5 227 506, WO 94/13682, WO 94/13324, WO 98/04569 Starret et al J Med Chem 37 1857-1864 (1994) and Iyer et al Tetrahedron Lett 30 7141-7144 (1989).

20

A further aspect of the invention comprises novel intermediates useful in applying structures of the formulae II''b to a drug and having the formula N-1:

- antihistamines such as terphenadine;
- analgesics such as diflunisal, naproxol, paracetamol, salicylamide and salicylic acid;
- antibiotics such as azidamphenicol, cefamandol, chloramphenicol, clavulanic acid, clindamycin, comptothecin, demeclocyclin, doxycyclin, imipenem, latamoxef,
- 5 novobiocin, oleandomycin, oxytetracyclin, tetracyclin and thiamenicol;
- prostaglandins such as arbaprostil, carboprost and prostacydin;
- antidepressives such as 8-hydroxychlorimipramine and 2-hydroxyimipramine;
- antihypertonics such as sotarol and fenoldopam;
- anticholinergics such as biperidine, carbidopa, procyclidin and trihexyphenidal;
- 10 antiallergenics such as cromolyn;
- glucocorticoids such as betamethasone, budenosid, chlorprednison, clobetasol, clobetasone, corticosteron, cortisone, cortodexon, dexamethason, flucortolon, fludrocortisone, flumethasone, flunisolid, fluprednisolon, flurandrenolide, flurandrenolon acetonide, hydrocortisone, meprednisone, methylprednisolon,
- 15 paramethasone, prednisolon, prednisol, triamcinolon and triamcinolon acetonide;
- narcotic agonists and antagonists such as
- apomorphine, buprenorphine, butorphanol, codein, cyclazocin, hydromorphon, ketobemidon, levallorphan, levorphanol, metazocin, morphine, nalbuphin, nalmefen, naloxon, nalorphine, naltrexon, oxycodon, oxymorphon and pentazocin;
- 20 stimulants such as mazindol and pseudoephedrine;
- anaesthetics such as hydroxydion and propofol;
- $\beta$ -receptor blockers such as acebutolol, albuterol, alprenolol, atenolol, betazolol, bucindolol, cartelolol, celiprolol, cetamolol, labetalol, levobunelol, metoprolol, metipranolol, nadolol, oxyprenolol, pindolol, propanolol and timolol;
- 25  $\alpha$ -sympathomimetics such as adrenalin, metaraminol, midodrin, norfenefrin, octapamine, oxedrin, oxilofrin, oximetazolin and phenylefrin;
- $\beta$ -sympathomimetics such as bamethan, clenbuterol, fenoterol, hexoprenalin, isoprenalin, isoxsuprin, orciprenalin, reproterol, salbutamol and terbutalin;
- bronchodilators such as carbutoleol, dyphyllin, etophyllin, fenoterol, pirbuterol,
- 30 rimiterol and terbutalin;
- cardiotonics such as digitoxin, dobutamin, etilefrin and prenalterol;
- antimycotics such as amphotericin B, chlorphenesin, nystatin and perimycin;

10015184-11601

anticoagulants such as acenocoumarol, dicoumarol, phenprocoumon and warfarin;  
vasodilators such as bamethan, dipyrimadol, diprophyllin, isoxsuprin, vincamin and  
xantinol nicotinate;

antihypocholesteremics such as compactin, eptastatin, mevinolin and simvastatin;

- 5 miscellaneous drugs such as bromperidol (antipsychotic), dithranol (psoriasis)  
ergotamine (migraine) ivermectin (antihelminthic), metronidazole and secnidazole  
(antiprotozoals), nandrolon (anabolic), propafenon and quinadine (antiarythmics),  
serotonin (neurotransmitter) and silybin (hepatic disturbance).

- 10 The above mentioned monohydric nucleosides are an example of the prodrugs of the  
invention applied to chain hydroxy functions, typically the 5' hydroxy function of the  
(pseudo)saccharide moiety of the nucleoside. However, the fatty acid free aspect of  
the invention is not limited to the monohydric nucleosides disclosed above, but is  
also applicable to L and D-nucleosides bearing di, tri and tetrahydric  
15 (pseudo)saccharides, such as those of the formula N-3:

where B is a natural or unnatural nucleotide base,

- 20  $R_{N1}$  is O or  $-\text{CH}_2-$ , S  
 $R_{N2}$  and  $R_{N3}$  are each H or  $R_{N2}$  is methylene or  $-\text{CH}(\text{OH})-$  and  $R_{N3}$  is a  
bond thereto, or  $R_{N2}$  and  $R_{N3}$  together are a bond;  
n is 0 or 1;  
one of  $R_{N3}$  and  $R_{N4}$  comprises a linker- $R_2$  structure such as those of  
25 formulae IIaa, II'aa, IIc', IIe', II f\*, id' and the other is hydrogen or a  
further linker- $R_2$  structure.

An alternative group drugs to which the invention is applicable includes those of  
formula N-3a:

M132US-1

where B, NR3 and NR4 are as defined above.

An alternative group of drugs within the scope of the invention has the formula N-3b:

where B, RN3 and RN4 are as defined above and RN6 is fluoro and RN7 is hydrogen or RN6 and RN7 are both fluoro or RN6 and RN7 together define an exo-methenyl group. The preferred base is guanine in this alternative.

A further group of nucleosides within the scope of the invention has the formula N-3c

where B, RN3 and RN4 are as defined above, RN8 and RN9 are fluoro (or one of them is fluoro and the other is hydrogen) or RN8 and RN9 together define exomethenyl or exomethenyl mono or di-substituted with fluoro. These nucleosides have anticancer activity.

The invention is also applicable to other nucleosides having at least two hydroxy groups, but outside the scope of formula N-3a-c, for instance, 9-[3,3-dihydroxymethyl-4-hydroxy-but-1-yl]guanine as described in WO 95/22330 and 9-[4-hydroxy-(2-hydroxymethyl)butyl]guanine as described in EP 343 133. The  
5 invention is applicable to both L and D stereo forms of the various nucleoside analogues

The compounds of the invention, especially cytosine or guanine derivatives where NR1 is oxygen, n is 1 and NR2 and NR5 define a ring are also active against certain  
10 retroviral infections, notably SIV, HIV-1 and HIV-2, and Hepatitis B virus. The compounds of the invention, especially cytosine, guanosine or 6-methoxyguanosine derivatives wherein NR1 is oxygen, n is 0 and NR2 and NR5 define an arabinose ring are potent anticancer compounds.

15 The compounds of the invention, especially derivatives comprising a 1,2,4-triazole-3-carboxamide base, where NR1 is O, NR2 is -CH(OH)-, NR3 is a bond thereto and n is 0 (ribavirin) are expected to be active against hepatitis C virus (HCV).  
Compounds comprising a substituted benzimidazole base, where NR1 is O, NR2 is -CH(OH)-, NR5 is a bond thereto and n is 0 (for instance Glaxo Wellcome's  
20 1263W94 where the base is 2-isopropylamin-5,6-dichloro-benzimidazol-3-yl) are expected to be active against CMV. Compounds comprising an adenine base, where NR1 is O, NR2 is -CH(OH)-, NR5 is a bond thereto and n is 0 (vidarabine) are expected to be active against HSV encephalitis. Compounds comprising a 2-chloroadenine base with a 2'-deoxyribose sugar are expected to have anticancer  
25 activity.

The nucleoside derivatives of the invention are particularly useful for guanine nucleoside and analogues which tend to have poorer uptake than pyrimidine nucleosides. Accordingly B is preferably guanine or a guanine derivative.

30

A group of hydroxy bearing drugs which are particularly amenable to the prodrugs of the invention are the ring hydroxy compounds. By ring hydroxy is meant that the

10015134-11601

hydroxy function to which the prodrug of the invention is bound is bonded directly onto an aromatic or non-aromatic, heterocyclic or carbocyclic ring structure.

- Examples of ring hydroxy compounds include the cyclic urea HIV protease inhibitors, such as those described in WO 9843969, WO9820008, and WO 9419329. Representative protease inhibitors include:

10 where R1 is NH<sub>2</sub> (DMP 450) or

(SD 146).

Some examples of phenolic ring hydroxy compounds include the PETT NNRTI discussed below or the compound described in J Med Chem 35 3467 (1992):

15

Pancratistatin described in Anticancer Drug Design 10: 243 & 299 (1995) and Bioorg Med Chem Lett 6 157 1996:

has both phenolic and carbocyclic ring hydroxy functions. A further useful drug with a combination of phenolic and carbocyclic hydroxy functions is etoposide:

- 5 as described in Bioorg Med Chem Lett 4 2567 (1994) and Clinical Cancer Res 1 105 1995.

Representative phosphorous containing drugs include phosfestrol, (E)-(α,β-diethyl-4,4'-stilbenylen)bis(dihydrogenphosphate) and cytostatic metabolites such as  
10 phosphorylated cytarabin or gemcitabin,

Other phosphonates include antiviral nucleoside or nucleotide analogues such as PMEA, HPMPC, PMPA and the like or phosphates such as the monophosphates of those nucleoside analogues which require phosphorylation for activity, such as ACV  
15 AZT, ddI, ddC, PCV, GCV, BVDU, FMAU, 3TC, FTC etc. As described above, certain mixed amino acid/fatty acid acyloxyalkylphosphonates are described in our copending application PCT SE97 001903 and it should be thus appreciated that the prodrugs of the present invention are fatty acyl-free and/or apply the novel linkers defined herein in the phosphonate nucleotide field.

Taking the phosphonate antivirals adefovir and cidovir as examples, prodrugs of the invention can be applied as shown in Formula PF2:

or

where

$R_2$  is the acyl residue of an aliphatic amino acid,

$R_{4L}$  and  $R_{4L'}$  are independently H,  $C_{1-3}$  alkyl,  $C_{3-6}$  cycloalkyl,  $C_{1-3}$  alkyl- $C_{1-6}$  cycloalkyl phenyl or benzyl,

$R_{4R}$  and  $R_{4R'}$  are independently H,  $C_{1-3}$  alkyl or phenyl

$ql$  is 0-3,  $qr$  is 0-3,

T is a bond,  $-NR_4-$  or  $-O-$

$R_4$  is H or  $C_{1-3}$  alkyl;

ring is an optionally substituted aromatic or non-aromatic, hetero- or carbocycle;

base is a natural or unnatural nucleotide base, especially guanine, adenine or cytosine,

$Rf3$  is H or a further structure of the formula II'b and  $Rf4$  is H or  $CH_2OH$ .

Currently favoured values in formula PF2 include:  $R_{3R}$  and  $R_{3R'}$  are preferably H and/or  $R_{3L}$  and  $R_{3L'}$  are preferably ethyl or especially methyl. T is preferably  $-O-$  or more preferably a bond. Preferably  $qr$  is 1 or more preferably 0.

A particularly preferred group of phosphorous containing drugs are the bisphosphonates active in bone metabolism. Favoured bis-phosphonates have the formula:

where

X is H, halo, hydroxy; and Y is

- a)  $C_{1-10}$  alkyl, optionally substituted with heterocycle,  $-NR_aR_b$ , where  $R_a$  and  $R_b$  are independently hydrogen,  $C_{1-6}$  alkyl or join together to form a 5 to 7 membered ring, optionally containing a further hetero atom, OH, halo,  $-S(C_{1-6}$  alkyl), phenyl,  $-C_{1-7}$  cycloalkyl, (optionally substituted with  $-NR_aR_b$  or OH);
- b)  $C_{3-7}$  cycloalkyl, optionally substituted with  $-NR_aR_b$ , OH, halo,  $-S(C_{1-6}$  alkyl), phenyl, morpholino or pyridyl;
- c) halo;

e) pyrrolidiny;

f) -S(C<sub>1-6</sub> alkyl), optionally substituted with

-NR<sub>4</sub>R<sub>6</sub>, OH, halo or phenyl;

g) -S-phenyl, optionally substituted with

- 5                    halo, nitro, C<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkoxy, trifluormethyl, -CONRaR<sub>6</sub> or  
-COOH.

- Preferred bis-phosphonates include alendronate (X is hydroxy, Y is  
NH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>-), clodronate (X is chloro, Y is chloro), etidronate (X is hydroxy, Y  
10 is CH<sub>3</sub>-), pamidronate (X is hydroxy, Y is NH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>-), ibandronate (X is hydroxy,  
Y is N (CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>)(CH<sub>3</sub>)CH<sub>2</sub>CH<sub>2</sub>-), tiludronate (X is H, Y is  
4-chlorophenylthio-), risedronate (X is hydroxy, Y is 3-pyridinylmethylene-) and  
zoledronate (X is hydroxy, Y is (2-(1H-imidazol-1-yl)methylene-)

- 15    Taking alendronate as an example:

- it will be apparent that the drug contains several accessible functions (viz the  
hydroxy group at position 1, the amino group at position 4 and two esterifiable  
hydroxy groups on each phosphorous. Prodrugs in accordance with the invention can  
20    thus be derivatised on one or more of these functions. For instance a linker such as  
those of Formula IIa above, for instance when T is a bond or -O- and V is a bond can  
be esterified to the 1-hydroxy position or amide-bonded to the 4-amino position. In a  
favoured embodiment of the invention, however, the prodrugs of the invention are  
derivatised to the phosphonate groups.

25

Thus one to three linker structures of formula IIe, II'e, Va, Vb or most preferably  
II'b can be esterified to one or both of the phosphonates, especially one such linker  
structure on each phosphonate.

Preferred compounds within this bis-phosphonate aspect of the invention thus include those of the formula A1:

A still further preferred group of prodrugs of the invention are those based on fosinoprilate having the formula PF3:

where

$R_2$  is the acyl residue of an aliphatic amino acid,

$R_{4L}$  and  $R_{4L}'$  are independently H,  $C_{1-3}$  alkyl,  $C_{1-6}$  cycloalkyl,  $C_{1-3}$  alkyl- $C_1C_6$  cycloalkyl

5 phenyl or benzyl,

$R_{4R}$  and  $R_{4R}'$  are independently H or  $C_{1-3}$  alkyl

ql is 0-3, qr is 0-3,

T is a bond,  $-NR_3-$  or  $-O-$

$R_3$  is H or  $C_{1-3}$  alkyl;

10 ring is an optionally substituted aromatic or non-aromatic, hetero-or carbocycle;  
and pharmaceutically acceptable salts thereof.

In formula PF3,  $R_{4R}$  and  $R_{4R}'$  are preferably H and/or  $R_{4L}$  and  $R_{4L}'$  are preferably ethyl or especially methyl. T is preferably  $-O-$  or more preferably a bond. Preferably  
15 qr is 1 or more preferably 0.

and pharmaceutically acceptable salts thereof.

Sub  
B21

15 A further phosphonate compound amenable to the prodrugs of the invention are the neutral endopeptidase inhibitors such as CGS-24592 (Novartis), preferably those of the formula PF6:

20

where

RF1 is H or a further structure of formula II''b

Rf2 is H or a conventional pharmaceutically acceptable ester,

R<sub>2</sub> is the acyl residue of an aliphatic amino acid,

R<sub>4L</sub> and R<sub>4L</sub>' are independently H, C<sub>1-3</sub> alkyl, C<sub>3-6</sub>cycloalkyl, C<sub>1-3</sub>alkyl-C<sub>1</sub>C<sub>6</sub>cycloalkyl

5 phenyl or benzyl,

R<sub>4R</sub> and R<sub>4R</sub>' are independently H or C<sub>1-3</sub> alkyl

ql is 0-3, qr is 0-3,

T is a bond, -NR<sub>4</sub>- or -O-

R<sub>4</sub> is H or C<sub>1-3</sub>alkyl;

10 ring is an optionally substituted aromatic or non-aromatic, hetero-or carbocycle.

Currently favoured values in Formula PF6 include: R<sub>4R</sub> and R<sub>4R</sub>' are preferably H and/or R<sub>4L</sub> and R<sub>4L</sub>' are preferably ethyl or especially methyl. T is preferably -O- or more preferably a bond. Preferably qr is 1 or more preferably 0. If Rf1 is a further  
15 ester it is convenient if it is identical to other linker-R<sub>2</sub> moiety. Conventional pharmaceutically acceptable esters for Rf2 include the methyl, ethyl and isopropyl esters.

A further convenient Drug for applying the prodrugs of the invention is the anti-  
20 Parkinsonian agent levodopa:

This drug has four accessible functions for applying the prodrugs of the invention, namely the 3 and 4 hydroxy groups on the phenyl and the amino and carboxy  
25 functions on the side chain.

A structure of the formula IIa or II'b be esterified to one or both of the aromatic hydroxyl functions or amide-bonded to the levodopa amino function. A trifunctional linker of Formula III or Formula IId, can be carbonyl bonded to the levodopa

carboxyl function. Such "blocked" carboxyl levodopa compounds are conceivably less susceptible to in vivo peripheral decarboxylation than levodopa and may thus allow the diminution or omission of the customarily coadministered decarboxylase inhibitors such as carbidopa.

5

A further convenient Drug for applying the prodrugs of the invention is chromoglycate, also known as cromolyn, useful in the treatment of asthma, allergic rhinitis, mastocytosis, ulcerative colitis and inflammatory bowel disease:

10

It will be apparent that cromolyn has three accessible functions suitable for applying the prodrugs of the invention. In particular, a linker of the formula II<sub>d</sub> can be carbonyl linked to either of the carboxy groups. As cromolyn is a symmetric compound it may be advantageous to bond a respective linker to each of the carboxyl groups. Alternatively or additionally, a linker of the formula II<sub>a</sub>, II'<sub>a</sub>, II<sub>d</sub>, II'<sub>d</sub> such as those wherein T is a bond or -O- and V is a bond can be esterified to the hydroxy group depending from the propylene bridge, optionally in conjunction with conventional pharmaceutical esters on the carboxy groups.

15

20 A further group of Drugs which are amenable to the prodrugs of the invention are the pain-killer opiates such as morphine:

Morphine and many of its analogues have a pair of hydroxy functions accessible to the prodrug approach of the invention. For instance a structure of formula IIa wherein T is a bond or -O- and V is a bond would be convenient for esterification with the 3 and/or 6 hydroxy groups.

A further convenient group of compounds include the macrolide antibiotics such as erythromycin and roxitromycin and antibacterial glycopeptides such as vancomycin.

A further convenient group of Drugs for applying the prodrugs of the invention are the rifamycin antibiotics:

- wherein the asterisks define the requisite number of aromatic bonds, including rifampicin ( $R_a$  is OH,  $R_b$  is  $-\text{CH}=\text{N}-(4\text{-N-methylpiperazine})$ ,  $R_c$  is hydroxy),  
 15 rifamide ( $R_a$  is  $\text{OCH}_2\text{CONH}(\text{C}_2\text{H}_5)_2$ ,  $R_b$  is hydrogen,  $R_c$  is hydroxy),  
 rifamycin B ( $R_a$  is  $-\text{OCH}_2\text{COOH}$ ,  $R_b$  is hydrogen,  $R_c$  is hydroxy),  
 rifamycin O ( $R_a$  is  $-1,3\text{-dioxolan-4-on-2-yl}$ ,  $R_b$  is hydrogen,  $R_c$  is hydroxy),  
 rifamycin S ( $R_a$  is  $=\text{O}$ ,  $R_b$  is hydrogen,  $R_c$  is  $=\text{O}$ ),  
 rifamycin SV ( $R_a$  is  $-\text{OH}$ ,  $R_b$  is hydrogen,  $R_c$  is  $-\text{OH}$ ),  
 20 rifaximin ( $R_a$  and  $R_b$  together define a structure:

rifabutinum ( $R_a$  and  $R_b$  together define a structure:

It will be apparent that the rifamycins have a number of free hydroxyls and secondary amines available for esterification or amide bonding with respective linker-R<sub>2</sub> groups in accordance with the invention such as those of Formula II'a or Formula IIa above, which linker group is bonded to one of said hydroxy or amino groups.

A further group of Drugs which are amenable to the prodrugs of the invention is the cephalosporin antibiotics:

Representative cephalosporins include:

- cefpodoxime (R<sub>a</sub> is [(2-amino-4-thiazolyl)(methoximino)acetyl]amino-, R<sub>b</sub> is H, R<sub>c</sub> is ethyl),
- 15 cefaclor (R<sub>a</sub> is aminophenylacetyl amino, R<sub>b</sub> is H, R<sub>c</sub> is chloro),
- cefadroxil (R<sub>a</sub> is [amino-(4-hydroxyphenyl)acetyl]amino, R<sub>b</sub> is H, R<sub>c</sub> is methyl);
- cefamandole (R<sub>a</sub> is [amino-(4-hydroxyphenyl)acetyl]amino, R<sub>b</sub> is H, R<sub>c</sub> is [1-methyl-1H-tetrazol-5-yl]thio]methyl);
- cefatrizine, (R<sub>a</sub> is [amino-(4-hydroxyphenyl)acetyl]amino, R<sub>b</sub> is H, R<sub>c</sub> is [1H-1,2,3-triazol-4-yl]thio]methyl);
- 20 cefazedone (R<sub>a</sub> is [(3,5-dichloro-4-oxo-1(4H)-pyridinyl)acetyl]amino, R<sub>b</sub> is H, R<sub>c</sub> is [(5-methyl-1,3,4-thiadiazol-2-yl)thio]methyl),
- cefazolin (R<sub>a</sub> is (1H-tetrazol-1-ylacetyl)-amino R<sub>b</sub> is H, R<sub>c</sub> is [(5-methyl-1,3,4-thiadiazol-2-yl)thio]methyl,

- cefbuparazone (Ra is [2-[[[(4-ethyl-2,3-dioxo-1-piperazinyl)carbonyl]amino]-3-hydroxy-1-oxobutyl]amino, Rb is OCH<sub>3</sub>, Rc is [(1-methyl-1H-tetrazol-5-yl)thio]methyl,
- 5 cefixime (Ra is [(2-amino-4-thiazolyl)[carboxymethoxy]imino]acetyl]amino, Rb is H, Rc is -CH=CH<sub>2</sub>),
- cefmnoxime, (Ra is [(2-amino-4-thiazolyl)(methoxyimino)acetyl]amino, Rb is H, Rc is [(1-methyl-1H-tetrazol-5-yl)thio]methyl),
- cefmatazole ([[(cyanomethyl)thio]acetyl]amino, Rb is H, Rc is [1-methyl-1H-tetrazol-5-yl]thio]methyl),
- 10 cefminox (Ra is [[[(2-amino-2-carboxyethyl)thio]acetyl]amino, Rb is OCH<sub>3</sub>, Rc is is [1-methyl-1H-tetrazol-5-yl]thio]methyl),
- cefodoxime (Ra is [(2-amino-4-thiazolyl)(methoxyimino)acetyl]amino, Rb is H, Rc is [[5-(carboxymethyl)-4-methyl-2-thiazolyl]thio]methyl),
- cefonicid (Ra is (hydroxyphenylacetyl)amino, Rb is H, Rc is [[1-8sulfomethyl]-1H-tetrazol-5-yl]thio]methyl),
- 15 cefoperazone (Ra is [[[(4-ethyl-2,3-dioxo-1-piperazinyl)carbonyl]amino](4-hydroxyphenyl)acetyl]amino, Rb is H, Rc is [(1-methyl-1H-tetrazol-5-yl)thio]methyl),
- ceforanide (Ra is [[2-(aminomethyl)phenyl]acetyl]amino, Rb is H, Rc is [[1-(carboxymethyl)-1H-tetrazol-5-yl]thio]methyl),
- 20 cefotaxime (Ra is [(2-amino-4-thiazolyl)(methoxyimino)acetyl]amino, Rb is H, Rc is (acetyloxy)methyl),
- cefotetan (Ra is [[4-(2-amino-1-carboxy-2-oxoethylidene)-1,3-dithietan-2-yl]carbonyl]amino, Rb is OCH<sub>3</sub>, Rc is [(1-methyl-1H-tetrazol-5-yl)thio]methyl, Rc is
- 25 [(1-methyl-1H-tetrazol-5-yl)thio]methyl),
- cefotiam (Ra is [(2-amino-4-thiazolyl)acetyl]amino, Rb is H, Rc is [[1-[2-(dimethylamino)ethyl]-1H-tetrazol-5-yl]thio]methyl),
- cefoxitin (Ra is (2-thienylacetyl)amino, Rb is OCH<sub>3</sub>, Rc is [aminocarbonyl]oxy]methyl),

10015184-111601

- cefpimizole (Ra is [[[5-carboxy-1H-imidazol-4-yl)carbonyl]amino]phenylacetyl]amino, Rb is H, Rc is (4'-(2-sulfoethyl)pyridinium methyl hydroxide inner salt,
- ceftipiramide (Ra is [[[4-hydroxy-6-methyl-3-pyridinyl)carbonyl]amino](4-hydroxyphenyl)acetyl]amino, Rb is H, Rc is [(1-methyl-1H-tetrazol-5-yl)thio]methyl),
- cefroxadine (Ra is (amino-1,4-cyclohexadien-1-yl-acetyl)amino, Rb is H, Rc is OCH<sub>3</sub>),
- cefsulodin (Ra is (phenylsulfoacetyl)amino, Rb is H, Rc is (4'-carbamoyl pyridinium)methyl hydroxide inner salt),
- ceftazidime (Ra is [(2-amino-4-thiazolyl)[(1-carboxy-1-methylethoxy)imino]acetyl]amino, Rb is H, Rc is pyridiniummethyl hydrochloride inner salt),
- cefteram (Ra is [(2-amino-4-thiazolyl)methoxyimino]acetyl]amino, Rb is H, Rc is (5-methyl-2H-tetrazol-2-yl)methyl),
- ceftezole (Ra is (1H-tetrazol-1-ylacetyl)amino, Rb is (1,3,4-thiadiazol-2-ylthio)methyl),
- ceftibuten (Ra is [2-(2-amino-4-thiazolyl)-4-carboxy-1-oxo-2-butenyl]amino, Rb is H, Rc is H)
- ceftiofur (Ra is [(2-amino-4-thiazolyl)(methoxyimino)acetyl]amino, Rb is H, Rc is [(2-furanylcarbonyl)thio]methyl),
- ceftizoxime (Ra is [(2-amino-4-thiazolyl)(methoxyimino)acetyl]amino, Rb is H, Rc is H),
- ceftriaxone (Ra is [(2-amino-4-thiazolyl)methoxyimino]acetyl]amino, Rb is H, Rc is [1,2,5,6-tetrahydro-2-methyl-5,6-dioxo-1,2,4-triazin-3-yl)thio]methyl),
- cefuroxime (Ra is [2-furanyl(methoxyimino)acetyl]amino, Rb is H, Rc is [(aminocarbonyl)oxy]methyl),
- cefuzonam (Ra is [(2-amino-4-thiazolyl)(methoxyimino)acetyl]amino, Rb is H, Rc is (1,2,3-thiadiazol-5-ylthio)methyl),
- cephacetrile (Ra is (cyanocetyl)amino, Rb is H, Rc is (acetyloxy)methyl),
- cephalexin (Ra is (aminophenylacetyl)amino, Rb is H, Rc is methyl),

10015184 111601

cephaloglycin (Ra is (aminophenylacetyl)amino, Rb is H, Rc is (acetyloxy)methyl),  
 cephaloridine (Ra is (2-thienylacetyl)amino, Rb is H, Rc is pyridinium methyl  
 hydroxide inner salt),

cephalosporin C (Ra is (5-amino-5-carboxy-1-oxopentyl)amino, Rb is H, Rc is  
 5 (acetyloxy)methyl),

cephalothin (Ra is (2-thienylacetyl)amino, Rb is H, Rc is (acetyloxy)methyl),

cephamycin A (Ra is (5-amino-5-carboxy-1-oxopentyl)amino, Rb is OCH<sub>3</sub>, Rc is  
 -CH<sub>2</sub>OCOC(OCH<sub>3</sub>)=CH-(4-oxysulphyl)phenyl),

cephamycin B (Ra is (5-amino-5-carboxy-1-oxopentyl)amino, Rb is OCH<sub>3</sub>, Rc is  
 10 -CH<sub>2</sub>OCOC(OCH<sub>3</sub>)=CH-(4-hydroxy)phenyl),

cephamycin C (Ra is (5-amino-5-carboxy-1-oxopentyl)amino, Rb is OCH<sub>3</sub>, Rc is  
 -CH<sub>2</sub>CONH<sub>2</sub>),

cephapirin (Ra is [(4-pyridinylthio)acetyl]amino, Rb is H, Rc is (acetyloxy)methyl),

cehradine (Ra is (amino-1,4-cyclohexadien-1-yl-acetyl)amino, Rb is H, Rc is CH<sub>3</sub>).  
 15

Common for the above cephalosporins is the presence of a carboxy group at the 2-  
 position which is amenable to derivation with a linker group, in particular those of  
 the Formula III & IIIc and IIc & IIc defined above. The above listed Ra, Rb and Rc  
 groups may also be combined in various permutations and the invention includes  
 20 prodrugs of all such cephalosporins.

A further group of Drugs which are amenable to the prodrugs of the invention are the  
 anticholinesterases such as tacrine:

25

where R is H or OH. It will be apparent that the tacrine itself (R=H) has a free amine  
 group suitable for derivatisation with a linker-R<sub>2</sub> group such as those of Formula IIa,  
 for instance when T is a bond or -O- and V is a bond. The tacrine metabolite (R =

OH), which is also active in vivo has an additional hydroxy function which can alternatively or additionally be derivatised with a linker such as those of Formula IIa, for instance when T is a bond or -O- and V is a bond.

- 5 A further group of Drugs which are amenable to the prodrugs of the invention are the sulphonamide diuretics such as furosemide:

- 10 It will be apparent that furosemide has a free carboxylic function, a primary amine and a secondary amine amenable to the prodrugs of the invention. In particular an  $R_2$  bearing linker, such as those of Formula III, III' or Formula II'd. II'd can be carbonyl linked to the free carboxy function. Alternatively or additionally, an  $R_2$  bearing linker, such as those of Formula IIa or II'a, for instance where T is a bond or -O- and
- 15 V is a bond can be amide bonded to the primary and/or secondary amine groups.

A further group of Drugs amenable to the prodrugs of the invention include the  $\alpha$ -1 and  $\beta$ -blocker carvedilol compounds:

- 20 Carvedilol has a free hydroxy function, a secondary heterocyclic amine and a further secondary amine on the side chain, which are amenable to the prodrugs of the invention, such as those of Formula II'a, for instance where T is a bond or -O- and V is a bond which is in turn linked to the hydroxy and/or the ring amine and/or the side chain amine functions on carvedilol.

A further group of Drugs which are amenable to the prodrugs of the invention are the hypolipaeamic statins, such as fluvastatin or compounds of the formula:

such as pravastatin ( $R_a = H$ ,  $R_b = OH$ ,  $R_c = H$ ,  $R_d = OH$ ) and

5 simvastatin ( $R_a = CH_3$ ,  $R_b = CH_3$ ,  $R_c$  and  $R_d$  together define a bond).

Taking simvastatin as an example, it will be apparent that there is a free side chain hydroxyl which is available for linkage with an  $R_2$  bearing linker, such as those of Formula IIa, for instance where T is a bond or -O- and V is a bond.

10

The statin pravastatin also bears a corresponding hydroxy function and can be derivatised with a linker in the same fashion. Pravastatin also bears a ring hydroxyl and a further side chain hydroxyl function which can be derivatised with a linker in a corresponding fashion. Pravastatin also bears a carboxyl function which can

15 additionally or alternatively be derivatised with an  $R_2$  bearing linker such as those of Formula III, III' or Formula IIId, IIId'.

A further group of Drugs which are amenable to the prodrugs of the invention are peptides and pseudopeptides such protease inhibitors including antifibrinolytics like

20 aprotinin or peptidomimetic aspartyl protease inhibitors such as renin inhibitors.

Other peptide Drugs include hormones such as vasopressins. Taking vasopressins as an example, peptide Drugs may be cyclic oligopeptides consisting solely of amino acids such as desmopressin or oxytocin, wherein the N and C terminals represent accessible functions for derivatisation in accordance with the invention. Additionally

25 many peptide drugs include amino acids with side chains bearing accessible functions such as arginine, serine or aspartate. Alternatively a peptide Drug, particularly peptidomimetics can be derivatised with non-amino acid structures bearing accessible functions such as somatostatin octreotide.

Useful oligopeptides for derivatisation according to the invention include MK 383, an Arg-Gly-Asp analogue useful as an antithrombotic, DADLE (Tyr-D-Ala-Gly-Phe-D-Leu), an enkephalin analogue and NISIN.

5

An exemplary group of protease inhibitors amenable to the invention comprises the HIV protease inhibitors bearing one or more chain hydroxy functions and/or one or more ring hydroxy functions such as the indanolamine terminal group in Mercks indinavir:

10

Favoured prodrugs of indinavir in accordance with the invention include

[1-(1S,2R), 5(S)]-2,3,5-trideoxy-N-(2,3-dihydro-2-butyryloxy-1H-inden-1-yl)-5-[2-  
 15 [[(1,1-dimethylethyl)amino]carbonyl]-4-(3-pyridinylmethyl)-1-piperazinyl]-2-  
 (phenylmethyl-D-erythro-pentonamide.

A further indanol based HIV protease inhibitors is Novartis/BMS SDZ PRI 053:

A further group of HIV protease inhibitors include the hexose derived compounds described in WO 98/45330, the contents of which are hereby incorporated by reference. These compounds typically have the general formula I:

wherein:

A' and A'' are independently a group of the formula II:

wherein:

- 10 R' is H, CH<sub>3</sub>, C(CH<sub>3</sub>)<sub>2</sub>, -OR<sup>a</sup>, -N(R<sup>a</sup>)<sub>2</sub>, -N(R<sup>a</sup>)OR<sup>a</sup> or -DP
- R''' is H, CH<sub>3</sub>; R<sup>a</sup> is H, C<sub>1</sub>-C<sub>3</sub> alkyl;
- D is a bond, C<sub>1-3</sub> alkylene, -C(=O)-, -S(O)- or -S(O)<sub>2</sub>-;
- P is an optionally substituted, mono or bicyclic carbo- or heterocycle;
- R'' is H, any of the sidechains found in the natural amino acids, carboxacetamide, or
- 15 a group (CH<sub>2</sub>)<sub>n</sub>DP;
- M is a bond or -C(=O)N(R''')-;
- Q is absent, a bond, -CH(OH)- or -CH<sub>2</sub>-;
- or R'' together with Q, M and R' define an optionally substituted 5 or 6 membered
- carbo- or heterocyclic ring which is optionally fused with a further 5 or 6 membered
- 20 carbo- or heterocyclic ring;
- with the proviso that R' is -OR<sup>a</sup>, -N(CH<sub>3</sub>)<sub>2</sub>, -N(R<sup>a</sup>)OR<sup>a</sup> or -DP if M is a bond and Q is
- absent;
- X is H, OH, OCH<sub>3</sub>;
- Y is H, OH, OCH<sub>3</sub>, but X and Y are not both H;
- 25 Z' and Z'' are independently -(CH<sub>2</sub>)<sub>m</sub>P where P is as defined above;

and n and m are independently 0, 1 or 2,  
and pharmaceutically acceptable salts thereof.

Carbocyclic groups for R' as -DP and/or Z'/Z'' and/or the optional substituents

- 5 thereto may be saturated, unsaturated or aromatic and include monocyclic rings such as phenyl, cyclohexenyl, cyclopentenyl, cyclohexanyl, cyclopentanyl, or bicyclic rings such as indanyl, naphthyl and the like.

Heterocyclic groups for R' as -DP and/or Z'/Z'' and/or the optional substituents

- 10 thereto may be saturated, unsaturated or aromatic and have 1 to 4 hetero atoms including monocyclic rings such as furyl, thienyl, pyranyl, pyrrolyl, pyrrolinyl, pyrrolidinyl, pyrazolyl, pyrazolinyl, pyrazolidinyl, imidazolyl, imidazolinyl, imidazolidinyl, pyridyl, piperidyl, pyrazinyl, piperazinyl, pyrimidinyl, pyridazinyl, oxazolyl, oxazolidinyl, isoxazolyl, isoxazolidinyl, morpholinyl, thiazolyl, 15 thiazolidinyl, isothiazolyl, isothiazolidinyl, and the like or bicyclic rings especially of the above fused to a phenyl ring such as indolyl, quinolinyl, isoquinolinyl, benzimidazolyl, benzothiazolyl, benzoxazolyl, benzothienyl etc. The carbo or heterocyclic ring may be bonded via a carbon or via a hetero atom, typically a nitrogen atom, such as N-piperidyl, N-morpholinyl etc.

20

Disclosed embodiments of Formula II for the A'/A'' groups of the compounds of formula I include those of the formula IIa:

25

IIa

where n is 1 or 2 and R' is alkyloxy, preferably methyloxy, or those where n is 0 and R' is methyl.

10015184-11601

Other disclosed groups of formula II include IIb below

5

An alternative configuration for the A'/A'' groups of the compounds of the invention includes groups of the formula IIc:

- 10 where Q is a bond, methylene or -C(OH)- and R' is -OR<sup>a</sup>, -N(R<sup>a</sup>)<sub>2</sub>, -NR<sup>a</sup>OR<sup>a</sup>, where R<sup>a</sup> is H or C<sub>1</sub>-C<sub>3</sub> alkyl, or a carbo- or heterocyclic group including N-piperidine, N-morpholine, N-piperazine, pyrrolyl, imidazolyl, pyrazolyl, pyridyl, pyrimidyl, pyrazinyl etc.

A subset of compounds within formula IIc has the formula IIId:

15

where R<sup>d</sup> is hydrogen or methyl (that is a valyl or isoleucyl side chain) and R<sup>e</sup> is

where X is methylene, O, S, S=O, S(=O)<sub>2</sub> or NH or R<sup>e</sup> is -N(CH<sub>3</sub>)<sub>2</sub>, -NHOH, -NHOMe, -NHOEt, -NMeOH, -NMeOMe etc.

20

In each of formulae IIa, IIb and IIc, R'' is hydrogen, methyl, ethyl, isopropyl, cycloalkyl such as cyclopropyl, cyclobutyl or cyclohexyl, cycloalkenyl, benzyl, carboxacetamide or 4-imidazolylmethy, any of which may be substituted as defined above. Preferred R'' groups include the side chains found in the natural amino acids, especially those of leucine, asparagine, histidine or proline. The most preferred R'' groups for formula IIa, IIb, IIc and II d are the isoleucyl and especially the valyl side chain.

R' will vary depending on the nature of Q and/or M, if present, and may for instance be selected from hydrogen, methyl, ethyl, isopropyl, R<sup>c</sup> as defined above, valinol, a heterocycle such as pyridyl, thiazole, oxazole, imidazole, N-piperidine, N-morpholine, N-piperazine, pyrrolyl, imidazolyl, pyrazolyl, pyrimidyl, pyrazinyl, any of which R' groups may be substituted as defined for Z'/Z'' below.

Further disclosed A'/A'' groups include those of formula II where R'', Q, M and R' together define an optionally substituted 5 or 6 membered carbo- or heterocyclic ring. A preferred group within this definition include groups within formula III:

where

R''' is as defined above,

R<sup>1</sup> is H, NR<sup>4</sup>R<sup>4</sup>, C(=O)R<sup>3</sup>, CR<sup>3</sup>R<sup>4</sup> or a monocyclic, optionally substituted carbo- or heterocycle;

R<sup>2</sup> is OH, or together with R<sup>1</sup> is =O, or if R<sup>1</sup> is NR<sup>4</sup>R<sup>4</sup>, then R<sup>2</sup> may be H;

R<sup>3</sup> is H, halo, C<sub>1</sub>-C<sub>3</sub> alkyl, OR<sup>5</sup>, NR<sup>4</sup>R<sup>4</sup>;

R<sup>4</sup> is H, C<sub>1</sub>-C<sub>3</sub> alkyl;

R<sup>5</sup> is H or a pharmaceutically acceptable ester;

R<sup>6</sup> is OH, NH<sub>2</sub>, carbamoyl or carboxy;

R<sup>7</sup> is hydrogen, C<sub>1</sub>-C<sub>4</sub> straight or branched alkyl or together with the adjacent carbon atoms forms a fused phenyl or heteroaromatic ring;

Preferred groups of formula III include aminoindanol and 1-amino-azaindan-2-ol, that is moieties of the formulae:

5

This aspect of the present invention thus provides compounds of the formula IV:

10

where A', A'', Z' and Z'' are as defined above, one of R<sub>X'</sub> and R<sub>X''</sub> is H, OH or OCH<sub>3</sub>, and the other one of R<sub>X'</sub> and R<sub>X''</sub> is a group of the formula -O-L-R<sub>y</sub> where R<sub>y</sub> is the acyl residue of an aliphatic amino acid and L is a bifunctional linker group.

- 15 With the expression "bifunctional linker group" is meant a group which bears a function amenable to an acyl bond with the carboxy function of the amino acid derivative R<sub>y</sub> and is also able to bond with an hydroxy function at the 3 or 4 position of the alkyl backbone of the structure of formula III. Exemplary L groups include an alkoxy moiety such as -CH<sub>2</sub>O-, -CH(CH<sub>3</sub>)O-, C(CH<sub>3</sub>)<sub>2</sub>O- and the like. Other
- 20 exemplary L groups include an alkoxyalkoxy moiety such as -CH<sub>2</sub>O-Alk-O-, -CH(CH<sub>3</sub>)O-Alk-O-, C(CH<sub>3</sub>)<sub>2</sub>O-Alk-O, where Alk is a C<sub>1</sub>-C<sub>6</sub> branched or straight chain saturated or unsaturated alkylene group, such as methylene, ethylene, 1,1-bismethylethylene and the like. Other exemplary L groups include derivatives of hydroxyalkanoic acids, where the carboxy function is acylated to the hydroxy

function at the 3 or 4 position of the backbone of the structure of formula III, while the hydroxy function is available for acylation with the carboxy function of the amino acid group  $R_y$ . Convenient hydroxyalkanoic acids include those derived from  $\alpha$ -hydroxy  $\omega$ -carboxylic acids such as carbonic acid, glycolic acid, hydroxypropanoic acid, hydroxybutyric acid, hydroxyvaleric acid or hydroxycaproic acid.

A number of convenient bifunctional linker groups are described in SE 9801216-4 which is hereby incorporated by reference, and also the disclosure of PCT/SE98/01467, also incorporated herein by reference.

Linkers prepared from  $\omega$ -hydroxybutyric derivatives are convenient as with these compounds hydrolysis and removal of the  $R_y$  group in vivo leaves a reactive terminal radical which will tend to cyclize and prompt the effective release of the mother protease inhibitor. Similarly, linkers of the formula  $L_a$ :

are convenient as enzymatic or spontaneous hydrolysis of a first of the  $R_y$  groups will result in an active terminus able to curl back and attack the acyl linkage to the mother compound thus promoting spontaneous release of the linker fragment. Other convenient linkers along the same principle have the formula  $L_b$  or  $L_c$ :

Preferred  $R_y$  groups include those derived from L-alanine, L-leucine and especially L-isoleucine and L-valine.

Favoured mother compounds within Formula IV include those of the formula IVA:

5

where  $R_d$  and  $R_{d'}$  are independently the side chain of an aliphatic L-amino acid, especially those of valyl or isoleucyl,

- 10 one of  $R_x$  and  $R_{x'}$  is hydroxy or hydrogen and the other is  $-O-L-R_y$ ,  
 and  $R_z$  and  $R_{z'}$  are independently H, halo, amino, mercapto, oxo, nitro,  $NHC_1-C_6$  alkyl,  $N(C_1-C_6 \text{ alkyl})_2$ ,  $C_1-C_6$  alkyl,  $C_1-C_6$  alkenyl,  $C_1-C_6$  alkynyl,  $C_1-C_6$  alkanoyl,  $C_1-C_6$  alkoxy, thio $C_1-C_6$  alkyl, thio $C_1-C_6$  alkoxy, hydroxy, hydroxy $C_1-C_6$  alkyl, halo $C_1-C_6$  alkyl, amino $C_1-C_6$  alkyl, cyano, carboxyl, carbalkoxy, carboxamide, carbamoyl  
 15 and the like, any of which alkyl moieties being optionally fluoro substituted, or an optionally substituted 5 or 6 membered carbocyclic or heterocyclic ring structure, such as cyclohexanyl, cyclohexenyl, phenyl, furyl, thienyl, pyranyl, pyrrolyl, pyrrolinyl, pyrrolidinyl, pyrazolyl, pyrazolinyl, pyrazolidinyl, imidazolyl, imidazolynyl, imidazolidinyl, pyridyl, piperidinyl, pyrazinyl, piperazinyl,  
 20 pyrimidinyl, pyridazinyl, oxazolyl, oxazolidinyl, isoxazolyl, isoxazolidinyl, morpholinyl, thiazolyl, thiazolidinyl, isothiazolyl, isothiazolidinyl, and the like. The ring structure may be bonded via a carbon atom or a hetero nitrogen. The ring structure may itself substituted with substituents as defined immediately above.

X ray crystallography indicates that there is significant scope for bulky substitution at  $R_1$  and/or  $R_2$  with (optionally substituted) groups such as para-phenyl, para-pyrid-2-yl, para-pyrid-3yl, para-thien-2-yl, parathien-3yl, para-pyrimid-2-yl, para-pyrimid-3-yl, para-pyrimid-4-yl and parathiazol-2-yl.

Alternatively or additionally  $R_1$  and/or  $R_2$  can comprise a smaller substituent intended for interaction with adjacent portions of the molecule. For instance, an ortho-fluoro group can hydrogen bond with any hydroxy groups present in A' or A'', thus serving to prevent hydrophobic collapse and/or functioning as a pseudoscaffold. This is best seen with the compounds of Formula IIIB below.

Exemplary compounds within Formula IVA thus include:

A variant of this aspect of the invention provides compounds generally in accordance with Formula IVA, but wherein one or both R<sub>4</sub> comprise an isobutyl moiety. The mother compounds of this variant are prepared with the dilactone opening procedure described in PCT/SE98/00622, employing L-tert-leucine methylamide (CAS reg nr. 89226-12-0). These mother compounds are themselves novel and define a further aspect of the invention.

Preferred compounds within thus variant include:

N1,N6-di[(1S)-2,2 dimethyl-1-(methylcarbamoyl)propyl]-(2R,3R,4R,5R)-2,5-di(benzyloxy)-3-hydroxy-4-(L-valyloxymethyloxy)hexanediamide,

An alternative preferred group of compounds of the invention are those of Formula IVB:

- 15 where  $R_x$ ,  $R_{x'}$ ,  $R_z$ , and  $R_{z'}$  are as defined above and wherein the ring atom adjacent one or both asterisks is optionally replaced by -N- to define a fused cyclopentanylpipridyl ring.

- 20 Currently preferred  $R_z$  and  $R_{z'}$  groups in Formula IV include ortho halogen, or phenyl, pyridyl, pyrimidyl, thiazolyl or thienyl in the para position relative to the linkage to the benzyloxy linkage. Especially preferred is orthofluoro as this appears to allow a favourable hydrogen bonding interaction with the hydroxy group on the adjacent indanol as depicted in the representative compound denoted IVB' below :

Exemplary compounds within Formula IVB thus include:

- N1,N6-di[(1S,2R)-2-hydroxy-2,3-dihydro-1*H*-1-indenyl]-(2R,3R,4R,5R)-2,5-di(benzyloxy)-3-hydroxy-4-(L-valyloxymethyloxy)hexanediamide,
- N1,N6-di[(1S,2R)-2-hydroxy-2,3-dihydro-1*H*-1-indenyl]-(2R,3R,4R,5R)-2,5-di(benzyloxy)-3-hydroxy-4-(L-valyloxy-(1-methyl)-methyloxy)hexanediamide,

A further aspect of the invention provides compounds wherein A' and A'' differ,  
preferably by including an amino terminus as depicted in Formula IVA (including  
20 the isobutyl variant) and an amino terminus as depicted in Form IVB or IVC below.  
Methodology for preparing such asymmetric mother compounds is disclosed in  
PCT/SE98/00622. Representative asymmetric compounds include those of the  
formula IVbb below:

where where X, Y,  $R_{2'}$ , and  $R_{2''}$  are as defined above, one of  $R_{xc}$  or  $R_{x'c}$  is  $-O-L-R_d$  and the other is OH or  $-O-L-R_d$ .  $R_{aa}$  is H or  $CH_3$  and the position adjacent the  
 5 asterisk is occupied by  $-CH-$  or  $-N-$  thereby defining a fused cyclopentanyphenyl or pyridyl ring.

Favoured mother compounds of formula IVbb include those where  $R_1$  and  $R_2$  are a cyclic group such as phenyl, pyridyl or the thiazolyl with the formula:

The compounds of formula IVbb (as with indinavir above) have chain hydroxy functions amenable to the invention, but more importantly also have an easily accessible ring hydroxy function on the indanol.

In keeping with the usual practice with retroviral inhibitors it is advantageous to co-administer one to three or more additional antivirals, such as AZT, ddI, ddC, d4T, 3TC, H2G, foscarnet, ritonavir, indinavir, saquinavir, nevirapine, delaviridine, efavirenz, amprenavir, Agouron AG1343 and the like. Such additional antivirals will normally be administered at dosages relative to each other which broadly reflect their respective therapeutic values. Molar ratios of 100:1 to 1:100, especially 25:1 to 1:25, relative to the compound or salt of formula I will often be convenient.

The compounds of the aspect of the invention discussed immediately above invention are generally prepared by alkylation or acylation of the respective mother compounds, which are in turn prepared by the methodology described in PCT/SE98/00622. Alkylation or acylation generally proceeds via an activated

derivative. The activated derivative used in an acylation may comprise e.g, the acid halide, acid anhydride, activated acid ester or the acid in the presence of coupling reagent, for example dicyclohexylcarbodiimide, where "acid" to a precursor group such as those of the formula  $\text{PGNHC(R}_y\text{)COO-L}_\alpha\text{-COOH}$ , where  $\text{R}_y$  is defined  
5 above, PG is a conventional N-protecting group and  $\text{L}_\alpha$  is the residue of the linker.

Activated  $\text{L-R}_y$  groups wherein L is derived from an hydroxyalkanoic acid are conveniently prepared by esterification of conventionally carboxy protected hydroxyalkanoic acid, such as glycollic acid or lactic acid or more preferably  
10 an  $\omega$ -hydroxyalkanoic acid such as 3-hydroxypropionic acid, 4-hydroxybutyric acid, 5-hydroxypentanoic acid etc with the appropriate N-protected  $\text{R}_y$  derivative, such as N-Cbz-isoleucine, either as the free acid in conjunction with a coupling agent such as DCC, or activated, for instance to the corresponding acid halide. The carboxy protecting group is removed as is known in the art and  
15 the resulting intermediate activated and esterified with the mother compound of formula IV, such as those of formula IVA, IVB or IVC with the methodology described above. The N-protecting group on  $\text{R}_y$  is then removed by conventional deprotection conditions.

20 Activated  $\text{L-R}_y$  groups wherein L is derived from a cis-alkenoic acid, such as 4-hydroxy-cis-but-2-en are conveniently prepared from the corresponding haloalkanoic acids, such as 4-bromo-cis-but-2-enoic acid which is carboxy protected, for instance with t-butyl prior to conventional esterification under with the appropriately N-protected  $\text{R}_y$  moiety, such as N-Cbz-valine. The carboxy  
25 protecting group is removed and the free carboxy activated and esterified with the mother compound of formula IV as described above, followed by deprotection of the N-protecting group.

Activated  $\text{L-R}_y$  groups wherein L is derived from a 2-hydroxymethylbenzoic  
30 acid can be prepared from 2-methylbenzoic acid which is carboxy protected and brominated by conventional techniques. This activated intermediate is esterified with an appropriately N-protected  $\text{R}_y$  moiety, such as Cbz-valine. This intermediate is carboxy deprotected and esterified with the mother

compound of formula IV as described above, followed by deprotection of the R<sub>y</sub> N-protecting group.

The term "N-protecting group" or "N-protected" as used herein refers to those groups intended to protect the N-terminus of an amino acid or peptide or to protect an amino group against undesirable reactions during synthetic procedures. Commonly used N-protecting groups are disclosed in Greene, "Protective Groups in Organic Synthesis" (John Wiley & Sons, New York, 1981), which is hereby incorporated by reference. N-protecting groups include acyl groups such as formyl, acetyl, propionyl, pivaloyl, t-butylacetyl, 2-chloroacetyl, 2-bromoacetyl, trifluoroacetyl, trichloroacetyl, phthalyl, o-nitrophenoxycarbonyl, α-chlorobutyryl, benzoyl, 4-chlorobenzoyl, 4-bromobenzoyl, 4-nitrobenzoyl, and the like; sulfonyl groups such as benzenesulfonyl, p-toluenesulfonyl, and the like, carbamate forming groups such as benzyloxycarbonyl, p-chlorobenzyloxycarbonyl, p-methoxybenzyloxycarbonyl, p-nitrobenzyloxycarbonyl, 2-nitrobenzyloxycarbonyl, p-bromobenzyloxycarbonyl, 3,4-dimethoxybenzyloxycarbonyl, 4-methoxybenzyloxycarbonyl, 2-nitro-4,5-dimethoxybenzyloxycarbonyl, 3,4,5-trimethoxybenzyloxycarbonyl, 1-(p-biphenyl)-1-methylethoxycarbonyl, α,α-dimethyl-3,5-dimethoxybenzyloxycarbonyl, benzhydryloxycarbonyl, t-butoxycarbonyl, diisopropylmethoxycarbonyl, isopropylloxycarbonyl, ethoxycarbonyl, methoxycarbonyl, allyloxycarbonyl, 2,2,2-trichloroethoxycarbonyl, phenoxycarbonyl, 4-nitrophenoxycarbonyl, fluorenyl-9-methoxycarbonyl, cyclopentylloxycarbonyl, adamantylloxycarbonyl, cyclohexylloxycarbonyl, phenylthiocarbonyl, and the like; alkyl groups such as benzyl, triphenylmethyl, benzyloxymethyl and the like; and silyl groups such as trimethylsilyl and the like. Favoured N-protecting groups include formyl, acetyl, allyl, F-moc, benzoyl, pivaloyl, t-butylacetyl, phenylsulfonyl, benzyl, t-butoxycarbonyl (BOC) and benzyloxycarbonyl (Cbz).

Hydroxy and/or carboxy protecting groups are also extensively reviewed in Greene ibid and include ethers such as methyl, substituted methyl ethers such as methoxymethyl, methylthiomethyl, benzyloxymethyl, t-butoxymethyl, 2-methoxyethoxymethyl and the like, silyl ethers such as trimethylsilyl (TMS), t-

butyldimethylsilyl (TBDMS) tribenzylsilyl, triphenylsilyl, t-butyl diphenylsilyl triisopropyl silyl and the like, substituted ethyl ethers such as 1-ethoxymethyl, 1-methyl-1-methoxyethyl, t-butyl, allyl, benzyl, p-methoxybenzyl, diphenylmethyl, triphenylmethyl and the like, aralkyl groups such as trityl, and pixyl (9-hydroxy-9-phenylxanthene derivatives, especially the chloride). Ester hydroxy protecting groups include esters such as formate, benzylformate, chloroacetate, methoxyacetate, phenoxyacetate, pivaloate, adamantate, mesitoate, benzoate and the like. Carbonate hydroxy protecting groups include methyl vinyl, allyl, cinnamyl, benzyl and the like.

- 10 Useful intermediates for acylation with the mother compounds thus include:  
3-N-Boc-L-valyloxypropanoic acid, 3-N-Fmoc-L-valyloxypropanoic acid, 3-N-CBZ-L-valyloxypropanoic acid, 3-N-Boc-L-isoleucyloxypropanoic acid, 3-N-Fmoc-L-isoleucyloxypropanoic acid, 3-N-CBZ-L-isoleucyloxypropanoic acid, 4-N-Boc-L-valyloxybutyric acid, 3-N-Fmoc-L-valyloxybutyric acid, 4-N-CBZ-L-valyloxybutyric acid, 4-N-Boc-L-isoleucyloxybutyric acid, 3-N-Fmoc-L-isoleucyloxybutyric acid, 3-N-CBZ-L-isoleucyloxybutyric acid and the like;  
15 and the activated derivatives, such as the acid halides

Still further useful intermediates include precursors, such as;

- 20 2-(L-valyloxy)propanoic acid, 2-(N-Boc-L-valyloxy)propanoic acid, 2-(N-Fmoc-L-valyloxy)propanoic acid, 2-(N-CBZ-L-valyloxy)propanoic acid, 2-(L-isoleucyloxy)propanoic acid, 2-(N-Boc-L-isoleucyloxy)propanoic acid, N-(Fmoc-L-isoleucyloxy)propanoic acid, N-(CBZ-L-isoleucyloxy)propanoic acid,  
25 2-(L-valyloxy)butyric acid, 2-(N-Boc-L-valyloxy)butyric acid, 2-(N-Fmoc-L-valyloxy)butyric acid, 2-(N-CBZ-L-valyloxy)butyric acid, 2-(L-isoleucyloxy)butyric acid, 2-(N-Boc-L-isoleucyloxy)butyric acid, N-(Fmoc-L-isoleucyloxy)butyric acid, N-(CBZ-L-isoleucyloxy)butyric acid, and the like;  
and activated derivatives thereof, such as the acid halides.

30

Still further novel intermediates include precursors such as:

- 3-ethoxycarbonyl-2-valyloxy-propionic acid  
3-ethoxycarbonyl-2-isoleucyloxy-propionic acid  
4-ethoxycarbonyl-2,3-bis-valyloxy-butyric acid  
4-ethoxycarbonyl-2,3-bis-isoleucyloxy-butyric acid  
5 3-benzyloxycarbonyl-2-valyloxy-propionic acid  
3-benzyloxycarbonyl-2-isoleucyloxy-propionic acid  
4-benzyloxycarbonyl-2,3-bis-valyloxy-butyric acid  
4-benzyloxycarbonyl-2,3-bis-isoleucyloxy-butyric acid, and the like;  
particularly those derived from "natural" configurations such as L-malic and L-  
10 tartaric acid, and the corresponding activated derivatives such as the acid  
halides.

- Alkylation of the mother compound of figure IV, for instance when group L-R<sub>n</sub> is derived from an alkoxyamino acid ester, is conveniently done with the  
15 corresponding N-protected haloalkoxyamino acid ester. Convenient alkylation intermediates thus include  
iodomethyloxy-N-CBz-valyl,  
iodomethyloxy-N-Boc-valyl,  
iodomethyloxy-N-Fmoc-valyl  
20 iodomethyloxy-N-CBz-isoleucyl,  
iodomethyloxy-N-Boc-isoleucyl,  
iodomethyloxy-N-Fmoc-isoleucyl,  
and corresponding derivatives bearing other N-protecting groups.

- 25 Further useful intermediates and methodology for acylation or alkylation of the mother compounds of formula IV are disclosed or suggested in (M132) SE 980216-4 filed 7 April 1998, the contents of which are specifically incorporated by reference.

- 30 Preparation of compounds of the formula IVB will generally require the indanolic hydroxy groups to be protected with conventional hydroxy protecting groups prior to esterification or alkylation of the 3 and/or 4 hydroxy groups of the alkyl backbone of the mother compound. On the other hand, the differential

10015134 " 111601

reactivity of the indanolic hydroxy groups means that the compounds of the formula IVC can generally be prepared without corresponding protection of the 3 and 4 hydroxy groups.

- 5 Preparation of compounds of the formula IVA and IVB may require relatively stringent esterification/alkylation conditions, thus favouring, for instance, esterification with haloactivated L-R<sub>x</sub> groups, as described above, rather than the use of a coupling agent.
- 10 A further useful group of compounds for applying the compounds of the invention are the phenolic hydroxy compounds of the PETT series of NNRTI disclosed in WO 93/03022, WO95/06034 and PCT/SE99/00053, the contents of which are incorporated by reference. Favoured ring hydroxy compounds of this class have the formula P1:

- 15 where one of Rp1-3 is hydroxy and the others are hydrogen, halo, C<sub>1-6</sub> alkanoyl, C<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkoxy etc as defined in WO95/06034, Rp4 and Rp5 are hydrogen or join to form a cis-cyclopropyl or cyclobutyl group, Rp6 is O or S and Rp7 is halo, cyano, amino etc as defined in WO95/06034. Particularly preferred compounds of this class
- 20 have the formula P2:

wherein

Rp8 is halo;

Rp9 is C<sub>1</sub>-C<sub>3</sub> alkyl;

Rp10 is halo, especially bromo or cyano.

- A preferred subset of compounds within Formula P2, particularly with regard to pharmacokinetics, has Rp10 as cyano. A further favoured subset of compounds within Formula P2, particularly with regard to ease of forming prodrugs, comprise
- 5 compounds wherein Rp10 is bromo.

Preferably Rp8 is chloro and more preferably fluoro. Suitable Rp9 groups include methyl, isopropyl, n-propyl and preferably ethyl.

- 10 As depicted in Formula P2, the cyclopropyl ring is in the *cis* configuration, allowing two enantiomers, 1S, 2S and 1R, 2R

- Each of these enantiomers are potent antiretrovirals, although the different
- 15 enantiomers can display subtle differences in physiological properties. For instance the 1S, 2S and 1R,2R enantiomers can show a different pattern of metabolism within the P450 system. The 1S,2S enantiomer of compounds wherein Rp10 is cyano is particularly preferred as it appears unique in being able to avoid key components of the P450 system. Other retroviral agents such as the HIV protease inhibitor ritonavir
- 20 interact extensively with the P450 system, leading to an array of undesirable physiological responses including extensive alteration of the metabolism of other co-administered drugs. This is of particular concern with pharmaceuticals administered for a chronic infection where patients can expect to take a number of pharmaceuticals for years, if not decades.

Preferred NNRTI mother compounds for applying the prodrugs of the invention thus include:

- (1S, 2S)-N-[*cis*-2-(6-fluoro, 2-hydroxy, 3-propionylphenyl)-cyclopropyl]-N'-(5-cyanopyrid-2-yl)-urea,
- 5 (1S, 2S)-N-[*cis*-2-(6-fluoro, 2-hydroxy, 3-butyrylphenyl)-cyclopropyl]-N'-(5-cyanopyrid-2-yl)-urea,
- (1S, 2S)-N-[*cis*-2-(6-fluoro, 2-hydroxy, 3-acetylphenyl)-cyclopropyl]-N'-(5-cyanopyrid-2-yl)-urea,
- (1S, 2S)-N-[*cis*-2-(6-fluoro, 2-hydroxy, 3-propionylphenyl)-cyclopropyl]-N'-(5-
- 10 bromopyrid-2-yl)-urea,
- (1S, 2S)-N-[*cis*-2-(6-fluoro, 2-hydroxy, 3-butyrylphenyl)-cyclopropyl]-N'-(5-bromopyrid-2-yl)-urea,
- (1S, 2S)-N-[*cis*-2-(6-fluoro, 2-hydroxy, 3-acetylphenyl)-cyclopropyl]-N'-(5-bromopyrid-2-yl)-urea,
- 15 and the corresponding R, R enantiomers.

This aspect of the invention thus provides prodrugs of NNRTI compounds of the formula P-1, especially P-2 wherein the phenolic hydroxy function is bonded to any of the generic structures above, such as those depicted in formula IIa, IIb, IIc, IId, IIe, IIe, Id, etc. These compounds are prepared by acylation of the relevant mother

20 compound of formula P-1 or P-2 with the activated structure IIa, IIb etc, wherein the or each R<sub>1</sub> group is conventionally N-protected.

As the compounds of formula P2 include an electron withdrawing group on the phenol ring to which the prodrug moiety is attached it is generally preferred to avoid

25 direct esters such as 4-valyloxybutyric acid derivatives which are otherwise effective on phenols and carbocyclic ring hydroxy functions.

Thus a convenient group of prodrugs within the scope of this aspect of the invention include those of the formula P3:

wherein

Rp8, Rp9, Rp10, R<sup>2</sup>, R<sub>4</sub> and R<sub>4</sub>' are as defined above. Typically both of R<sub>4</sub> and R<sub>4</sub>' are H.

10 Preferred compounds within Formula P3 include;

(1S, 2S)-N-{*cis*-2-[6-fluoro-2-(L-valyloxymethyloxy)-3-propionylphenyl]cyclopropyl}-N'-[2-(5-cyanopyridyl)]urea,

(1S, 2S)-N-{*cis*-2-[6-fluoro-2-(L-isoleucyloxymethyloxy)-3-propionylphenyl]cyclopropyl}-N'-[2-(5-cyanopyridyl)]urea,

15 (1R, 2R)-N-{*cis*-2-[6-fluoro-2-(L-valyloxymethyloxy)-3-propionylphenyl]cyclopropyl}-N'-[2-(5-cyanopyridyl)]urea,

(1R, 2R)-N-{*cis*-2-[6-fluoro-2-(L-isoleucyloxymethyloxy)-3-propionylphenyl]cyclopropyl}-N'-[2-(5-cyanopyridyl)]urea,

and pharmaceutically acceptable salts thereof.

An alternative preferred group of prodrugs of the invention have the Formula P4:

5

where Rp8, Rp9, Rp10, R<sub>4</sub> and R<sub>4</sub>' are as defined above. L and R<sub>2</sub> define a linker group and residue of an aliphatic amino acid, such as those of Formulae IIa, IIb, IIc, II<sub>d</sub>, IIe, II<sub>f</sub> or those depicted in Formulae Ia and Id. Typically both of R<sub>4</sub> and R<sub>4</sub>' are

10 H.

Favoured compounds within the class described in the immediately preceding paragraph include those of the formula P5:

15

where Rp8, Rp9, Rp10, R<sub>4</sub>, R<sub>4</sub>' and R<sub>2</sub> are as defined above and Alk<sup>b</sup> is C<sub>1</sub>-C<sub>6</sub>, optionally branched, optionally monounsaturated alkyl.

20 Favoured compounds within Formula P5 thus include:

- (1S, 2S)-N-{*cis*-2-[6-fluoro-2-(2,2-dimethyl-3-(L-valyloxy)-propionyl-oxymethyloxy)-3-propionylphenyl]-cyclopropyl}-N'-[2-(5-cyanopyridyl)] urea,  
(1S, 2S)-N-{*cis*-2-[6-fluoro-2-(2-methyl-3-(L-valyloxy)-propionyl-oxymethyloxy)-3-propionylphenyl]-cyclopropyl}-N'-[2-(5-cyanopyridyl)] urea,  
5 (1S, 2S)-N-{*cis*-2-[6-fluoro-2-(3-(L-valyloxy)-propionyl-oxymethyloxy)-3-propionylphenyl]-cyclopropyl}-N'-[2-(5-cyanopyridyl)] urea,  
  
(1S, 2S)-N-{*cis*-2-[6-fluoro-2-(2,2-dimethyl-3-(L-valyloxy)-propionyl-oxymethyloxy)-3-propionylphenyl]-cyclopropyl}-N'-[2-(5-bromopyridyl)] urea,

where each of the variables is as defined above.

This Formulae P aspect of the invention further provides pharmaceutical compositions comprising the compounds of formula and pharmaceutically acceptable carriers or diluents therefor. Additional aspects of the invention provide methods for the inhibition of HIV comprising administering a compound of the formula I to a subject afflicted with HIV. The invention also extends to the use of the compounds of formula I in therapy, such as in the preparation of a medicament for the treatment of HIV infections.

In treating conditions caused by HIV, the compounds of formula I are preferably administered in an amount to achieve a plasma level of the compounds of Formula P1 of around 10 to 1000 nM and more preferably 100 to 500 nM. This corresponds to a dosage rate, depending on the bioavailability of the formulation, of the order 0.01 to 10 mg/kg/day, preferably 0.1 to 2 mg/kg/day. A typical dosage rate for a normal adult will be around 0.05 to 5 g per day, preferably 0.1 to 2 g such as 500-750 mg, in one to four dosage units per day.

In keeping with the usual practice with HIV inhibitors it is advantageous to co-administer one to three additional antivirals to provide synergistic responses and to ensure complementary resistance patterns. Such additional antivirals may include AZT, ddI, ddC, D4T, 3TC, abacavir, adefovir, adefovir dipivoxil, bis-POC-PPMPA, foscarnet, hydroxyurea, Hoechst-Bayer HBY 097, efavirenz, trovirdine, nevirapine, delaviridine, PFA, H2G, ABT 606, DMP-450, loviride, ritonavir, saquinavir, indinavir, amprenavir (Vertex VX 478), nelfinavir and the like, typically at molar ratios reflecting their respective activities and bioavailabilities. Generally such ratio will be of the order of 25:1 to 1:25, relative to the compound of formula I.

Compounds of this Formulae P aspect of the invention are typically prepared by alkylation of the corresponding mother compounds of Formula P1 or especially P2, which are prepared by conventional means, such as the methodology described in WO95/06034 or PCT/SE99/00053. In particular, the preparation of compounds of formula P-3 or P-4 generally proceeds by alkylation using conventional coupling conditions of a compound of the formula P-2 with the corresponding intermediate:

where Rx and L are as defined above and R<sub>2</sub><sup>\*</sup> is R<sub>2</sub> as defined, but N-protected with a conventional N-protecting group. Preferably the halogen activating group is iodo, which is in turn prepared by iodination of the corresponding chloro analogue. Typical coupling conditions include treatment with a base in an organic solvent such as THF prior to addition of the halogenated intermediate followed by conventional

deprotection of the R<sub>2</sub> N-protecting group.

Compounds of formula P-8 are generally prepared by esterification of a compound of the formula P-2 with an intermediate of the formula:

where  $\text{Alk}^{\text{b}*}$  is a functionalised  $\text{Alk}^{\text{b}}$  as described above, for example chloromethyl chloroformate, in an organic solvent, followed by iodination of the terminal chloro  
 5 with NaI (or other activation of the functionalising group) and reaction with an N-protected  $\text{R}_2$ .

The compounds of the invention can form salts which form an additional aspect of  
 10 the invention. Appropriate pharmaceutically acceptable salts of the compounds of Formula I include salts of organic acids, especially carboxylic acids, including but not limited to acetate, trifluoroacetate, lactate, gluconate, citrate, tartrate, maleate, malate, pantothenate, isethionate, adipate, alginate, aspartate, benzoate, butyrate, digluconate, cyclopentanate, glucoheptanate, glycerophosphate, oxalate, heptanoate,  
 15 hexanoate, fumarate, nicotinate, palmoate, pectinate, 3-phenylpropionate, picrate, pivalate, propionate, tartrate, lactobionate, pivate, camphorate, undecanoate and succinate, organic sulphonic acids such as methanesulphonate, ethanesulphonate, 2-hydroxyethane sulphonate, camphorsulphonate, 2-naphthalenesulphonate, benzenesulphonate, p-chlorobenzenesulphonate and p-toluenesulphonate; and  
 20 inorganic acids such as hydrochloride, hydrobromide, hydroiodide, sulphate, bisulphate, hemisulphate, thiocyanate, persulphate, phosphoric and sulphonic acids. The compounds of the invention I may be isolated as the hydrate.

While it is possible for the active agent to be administered alone, it is preferable to  
 25 present it as part of a pharmaceutical formulation. Such a formulation will comprise the above defined active agent together with one or more acceptable carriers or excipients and optionally other therapeutic ingredients. The carrier(s) must be acceptable in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient.

30 The formulations include those suitable for rectal, nasal, topical (including buccal and sublingual), vaginal or parenteral (including subcutaneous, intramuscular,

intravenous and intradermal) administration, but preferably the formulation is an orally administered formulation. The formulations may conveniently be presented in unit dosage form, e.g. tablets and sustained release capsules, and may be prepared by any methods well known in the art of pharmacy.

5

Such methods include the step of bringing into association the above defined active agent with the carrier. In general, the formulations are prepared by uniformly and intimately bringing into association the active agent with liquid carriers or finely divided solid carriers or both, and then if necessary shaping the product. The invention extends to methods for preparing a pharmaceutical composition comprising bringing a compound of Formula I or its pharmaceutically acceptable salt in conjunction or association with a pharmaceutically acceptable carrier or vehicle. If the manufacture of pharmaceutical formulations involves intimate mixing of pharmaceutical excipients and the active ingredient in salt form, then it is often preferred to use excipients which are non-basic in nature, i.e. either acidic or neutral.

Formulations for oral administration in the present invention may be presented as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active agent; as a powder or granules; as a solution or a suspension of the active agent in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water in oil liquid emulsion and as a bolus etc.

With regard to compositions for oral administration (e.g. tablets and capsules), the term suitable carrier includes vehicles such as common excipients e.g. binding agents, for example syrup, acacia, gelatin, sorbitol, tragacanth, polyvinylpyrrolidone (Povidone), methylcellulose, ethylcellulose, sodium carboxymethylcellulose, hydroxypropylmethylcellulose, sucrose and starch; fillers and carriers, for example corn starch, gelatin, lactose, sucrose, microcrystalline cellulose, kaolin, mannitol, dicalcium phosphate, sodium chloride and alginic acid; and lubricants such as magnesium stearate, sodium stearate and other metallic stearates, stearic acid, glycerol stearate, silicone fluid, talc waxes, oils and colloidal silica. Flavouring agents such as peppermint, oil of wintergreen, cherry flavouring or the like can also

A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active agent in a free flowing form such as a powder or granules, optionally mixed with a binder, lubricant, inert diluent, preservative, surface-active or dispersing agent. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may be optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active agent.

Compounds of Formula IVe will be especially useful for Drugs bearing carboxy functions (especially those where T is O,  $R_3$  is Me and  $R_3'$  is H) or phosphonyl functions (especially those where T is a bond,  $R_3$  is isopropyl and  $R_3'$  is H).

Alternative preferred di- or trifunctional linker compounds of this aspect of the invention include compounds of the Formulae IIIa:

where  $R_2$ , A, A', n, m, Q and Alk are as defined above and  $R_4$  is hydroxy or an activating moiety such as halo, including chloro, iodo and bromo.

In practice linker compounds of Formula IVa or the corresponding derivative of Formula II'a will be esterified to hydroxy-bearing Drugs using conventional acylation techniques. The activated moiety of Formula IV may be preformed or generated in situ by the use of reagents such as dicyclohexylcarbodiimide (DCC) or O-(1H-benzotriazol-1-yl) N,N,N',N'-tetramethyluronium tetrafluoroborate (TBTU). When an acid halide, such as the acid chloride is used, a tertiary amine catalyst, such as triethylamine, N,N'-dimethylaniline, pyridine or dimethylaminopyridine may be added to the reaction mixture to bind the liberated hydrohalic acid.

10015184-111601

10015134-11601

The reactions are preferably carried out in an unreactive solvent such as N,N-dimethylformamide, tetrahydrofuran, dioxane, acetonitrile or a halogenated hydrocarbon, such as dichloromethane. If desired, any of the above mentioned tertiary amine catalysts may be used as solvent, taking care that a suitable excess is present. The reaction temperature can typically be varied between - 20° C and 60° C, but will preferably be kept between 5° and 50° C. After a period of 1 to 60 hours the reaction will usually be essentially complete. The progress of the reaction can be followed using thin layer chromatography (TLC) and appropriate solvent systems. In general, when the reaction is completed as determined by TLC, the product is extracted with an organic solvent and purified by chromatography and/or recrystallisation from an appropriate solvent system.

By-products where acylation has taken place on an inappropriate function can be separated by chromatography, but such misacylation can be minimized by controlled reaction conditions. These controlled conditions can be achieved, for example, by manipulating the reagent concentrations or rate of addition, especially of the acylating agent, by lowering the temperature or by the choice of solvent. The reaction can be followed by TLC to monitor the controlled conditions. It may additionally or alternatively be convenient to protect exposed hydroxy and other functions on the Drug with conventional protecting groups to forestall misacylation.

Linkers of Formula IVa or the corresponding derivatives of Formula II'a may alternatively be amide bonded to free primary or secondary amine functions on the Drug using conventional chemistry in the peptide art.

Linkers of Formula IIIa or IVd or the corresponding derivatives of Formula III' and II'd will generally be acylated to free carboxyl functions on the Drug in an analogous, but reversed fashion to the above described acylation of Drugs with hydroxy functions. US 4 486 425 which is incorporated by reference illustrates a convenient process.

Linkers of Formula IVa wherein V comprises a structure of the formula IIc can be prepared by a by a two stage process. In particular a compound of the formula  $\text{ClC(=O)OC(R}_4\text{)(R}_4'\text{)Cl}$  can be reacted with a suitable accessible hydroxy function on the Drug (optionally protected on other functions with conventional protecting groups) as is known in the cephalosporin art. The resulting Drug-O- $\text{C(=O)OC(R}_4\text{)(R}_4'\text{)chloride}$  is then reacted with an  $\text{R}_2$  bearing linker wherein a free function comprises a carboxyl function, such as the potassium salt.

Linkers of Formula IVe or the corresponding derivatives of Formula IIe can be esterified to phosphonyl and phosphoryl functions of Drugs analogously to the processes shown in US 4 337 201 and US 5 227 506, which are incorporated by reference. Corresponding methodology is applicable when  $\text{R}_2$  is esterified to a phosphonyl or phosphoryl group via a spacer of the Formula IIb as defined above.

The preparation of further linker groups and their application to Drugs is shown in the following Examples.

As the Drugs envisaged in the use of the present invention are proven pharmaceuticals, the starting materials for preparing the prodrugs of the invention are either available in commerce or are extensively described in the medical literature, including the FDA and other registration files for the respective drugs.

The term "N-protecting group" or "N-protected" as used herein refers to those groups intended to protect the N-terminus of an amino acid or peptide or to protect an amino group against undesirable reactions during synthetic procedures. Commonly used N-protecting groups are disclosed in Greene, "Protective Groups in Organic Synthesis" (John Wiley & Sons, New York, 1981), which is hereby incorporated by reference. N-protecting groups include acyl groups such as formyl, acetyl, propionyl, pivaloyl, t-butylacetyl, 2-chloroacetyl, 2-bromoacetyl, trifluoroacetyl, trichloroacetyl, phthalyl,

- o-nitrophenoxyacetyl,  $\alpha$ -chlorobutyryl, benzoyl, 4-chlorobenzoyl, 4-bromobenzoyl, 4-nitrobenzoyl, and the like; sulfonyl groups such as benzenesulfonyl, p-toluenesulfonyl, and the like, carbamate forming groups such as benzyloxycarbonyl, p-chlorobenzyloxycarbonyl, p-methoxybenzyloxycarbonyl,
- 5 p-nitrobenzyloxycarbonyl, 2-nitrobenzyloxycarbonyl, p-bromobenzyloxycarbonyl, 3,4-dimethoxybenzyloxycarbonyl, 4-methoxybenzyloxycarbonyl, 2-nitro-4,5-dimethoxybenzyloxycarbonyl, 3,4,5-trimethoxybenzyloxycarbonyl, 1-(p-biphenyl)-1-methylethoxycarbonyl,  $\alpha,\alpha$ -dimethyl-3,5-dimethoxybenzyloxycarbonyl, benzhydryloxycarbonyl, t-butoxycarbonyl,
- 10 diisopropylmethoxycarbonyl, isopropylloxycarbonyl, ethoxycarbonyl, methoxycarbonyl, allyloxycarbonyl, 2,2,2-trichloroethoxycarbonyl, phenoxycarbonyl, 4-nitrophenoxycarbonyl, fluorenyl-9-methoxycarbonyl, cyclopentylloxycarbonyl, adamantylloxycarbonyl, cyclohexylloxycarbonyl, phenylthiocarbonyl, and the like; alkyl groups such as benzyl, triphenylmethyl, benzyloxymethyl and the like; and silyl groups such as trimethylsilyl and the like.
- 15 Favoured N-protecting groups include formyl, acetyl, benzoyl, pivaloyl, t-butylacetyl, phenylsulfonyl, benzyl, t-butoxycarbonyl (BOC) and benzyloxycarbonyl (Cbz).
- 20 Hydroxy and/or carboxy protecting groups are also extensively reviewed in Greene *ibid* and include ethers such as methyl, substituted methyl ethers such as methoxymethyl, methylthiomethyl, benzyloxymethyl, t-butoxymethyl, 2-methoxyethoxymethyl and the like, silyl ethers such as trimethylsilyl (TMS), t-butyltrimethylsilyl (TBDMS) tribenzylsilyl, triphenylsilyl, t-butyltriphenylsilyl
- 25 triisopropyl silyl and the like, substituted ethyl ethers such as 1-ethoxymethyl, 1-methyl-1-methoxyethyl, t-butyl, allyl, benzyl, p-methoxybenzyl, diphenylmethyl, triphenylmethyl and the like, aralkyl groups such as trityl, and pixyl (9-hydroxy-9-phenylxanthene derivatives, especially the chloride). Ester hydroxy protecting groups include esters such as formate, benzylformate, chloroacetate, methoxyacetate,
- 30 phenoxyacetate, pivaloate, adamantate, mesitoate, benzoate and the like. Carbonate hydroxy protecting groups include methyl vinyl, allyl, cinnamyl, benzyl and the like.

N-BOC-L-isoleucine iodomethyl ester

1005184-11501

a) N-BOC-L-isoleucine chloromethyl ester

5 To a solution of N-BOC-L-isoleucine (23.1 g, 0.1 mol) in dioxane (500 mL), was added dropwise a 40% aqueous solution of tetrabutylammonium hydroxide (65.6 mL, 0.1 mol). After stirring for 15 min, the solution was evaporated to dryness through co-evaporation with dioxane and toluene. The residue was dissolved in dichloromethane (500 mL) and then chloriodomethane (72.8 mL, 1 mol) was added  
10 and the solution was stirred for 6h at room temperature. The solution was concentrated under reduced pressure and the residue was shaken with hexane / ethyl acetate (1:1 v/v, 400 mL). The yellow crystalline solid was filtered off and the filtrate was washed with aqueous solution of sodium thiosulfate (0.1 M) and then filtered through anhydrous sodium sulfate and evaporated to dryness. The residue was  
15 column chromatographed (silica gel, 1-2% MeOH in CH<sub>2</sub>Cl<sub>2</sub>), to give 20.8 g of N-BOC-L-isoleucine chloromethyl ester.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 5.86 (d, 1H), 5.60 (d, 1H), 5.04 (d, 1H), 4.32-4.25 (m, 1H), 2.00-1.80 (m, 1H), 1.42 (s, 9H), 1.50-1.05 (m, 2H), 0.96-0.87 (m, 6H).

b) N-BOC-L-isoleucine iodomethyl ester

To a solution of N-BOC-L-isoleucine chloromethyl ester (19.6 g, 70 mmol) in acetonitrile (300 mL), was added sodium iodide (31.5 g, 210 mmol). The solution  
25 was stirred for 4 h at 60 °C. The resulting suspension was filtered and the filtrate was evaporated. The residue was dissolved in CH<sub>2</sub>Cl<sub>2</sub> and washed with aqueous sodium thiosulfate (0.1 M). The organic phase was dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated under reduced pressure. The crude product was column chromatographed (silica gel, 2% MeOH in CH<sub>2</sub>Cl<sub>2</sub>), to give 22.6 g of N-BOC-L-isoleucine iodomethyl ester.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 6.04 (d, 1H), 5.82 (d, 1H), 4.97 (d, 1H), 4.25 (dd, 1H), 1.98-1.80 (m, 1H), 1.43 (s, 9H), 1.50-1.05 (m, 2H), 0.97-0.88 (m, 6H).

2,2-dimethyl-3-(N-Boc-L-valyloxy)propionic acid iodomethyl ester

10 a) 2,2-dimethyl-3-(N-Boc-L-valyloxy)propionic acid:

N-Boc-L-valine (10.8g, 50 mmole), 4-dimethylaminopyridine (610 mg, 5 mmole) and DCC (6.18 g, 30 mmole) were dissolved in methylene chloride (100 ml). After stirring for 2 hour the mixture was filtered. To the filtrate were added 2,2-dimethyl-3-hydroxy-propionic acid (3.54g, 30 mmole) and pyridine (10 ml). After 18 hr, the reaction mixture was filtered, and the filtrate was poured into sodium hydrogen carbonate aqueous solution, the organic phase was then washed with citric acid aqueous solution and water succesively. After evaporation the product was isolated with silica gel column chromatography to yield 4.4g. This compound can be  
20 activated and esterified directly to a drug or further modified as described below.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 5.10 (d, 1H) 4.24 (m, 3H) 2.18 (m, 1H) 1.51 (s, 9H) 1.33 (d, 6H) 0.98 (m, 6H).

25 b) 2,2-dimethyl-3-(N-Boc-L-valyloxy)propionic acid chloromethyl ester

2,2-dimethyl-3-(N-Boc-L-valyloxy)propionic acid (3.9 g, 12.3 mmole) was dissolved in dioxane (60 ml). To the solution was added tetrabutylammonium hydroxide aqueous solution (40 %, 7.78 ml, 12 mmole). The solution was dried in vacuo, and it  
30 was coevaporated with toluene for several times. The residue was dissolved in methylene chloride and then chloriodomethane (18.9 ml, 260 mmole) was added to

1,3-bis(N-tert-butoxycarbonyl-L-valyloxy)-2-propyl iodomethyl carbonate)

10 a) 1-*O*-(*N*-tert-butoxycarbonyl-L-valyl)glycerol

*N*-tert-Butoxycarbonyl-L-valine (32.53 g, 0.150 mol), *N,N'*-dicyclohexylcarbodiimide (37.85 g, 0.183 mol, and 4-dimethylaminopyridine (1.83 g, 0.015 mol) were added to glycerol (138.12 g, 1.5 mol) in 500 mL dry DMF and the mixture was stirred at rt under N<sub>2</sub> for 3 days. The reaction mixture was filtered, concentrated under vacuum, and then partitioned between 300 mL EtOAc and 150 mL H<sub>2</sub>O. The aqueous phase was reextracted with 150 mL EtOAc. The organic phases were combined and washed successively with 100 mL each of saturated aqueous NaHCO<sub>3</sub>, saturated NH<sub>4</sub>Cl, and brine. Drying over anhydrous Na<sub>2</sub>SO<sub>4</sub>, and concentration under vacuum gave a viscous light yellow oil as crude product. Flash column chromatography on silica gel with 4/1 EtOAc - petroleum ether (BP 40-60 °C) gave 18.27 g (42%) of product (alternative nomenclature: 3-(*N*-tert-butoxycarbonyl-L-valyloxy)-1,2-propanediol). Reactions done overnight gave similar yields.

c) 2-*O*-chloromethoxycarbonyl-1,3-di-*O*-(*N*-tert-butoxycarbonyl-L-valyl)glycerol

Chloromethyl chloroformate (2.70 mL, 30 mmol) was added to a solution of 1,3-di-*O*-(*N*-tert-butoxycarbonyl-L-valyl)glycerol (7.27 g, 14.8 mmol) and pyridine (7.2 mL, 89 mmol) in 60 mL dry CH<sub>2</sub>Cl<sub>2</sub>, in an ice bath, under N<sub>2</sub>. After stirring for 1 h 45 min, the reaction mixture was diluted with 100 mL CH<sub>2</sub>Cl<sub>2</sub> and washed with 40 mL water. The aqueous phase was reextracted with 20 mL H<sub>2</sub>O. The organic phases were combined, washed with 40 mL saturated NaHCO<sub>3</sub>, followed by 2 x 50 mL brine, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated under vacuum. Flash column chromatography on silica gel with 2/1 hexane- EtOAc gave 8.03 g (93%) of the title compound (alternative nomenclature: 1,3-bis(*N*-tert-butoxycarbonyl-L-valyloxy)-2-propyl chloromethyl carbonate).

<sup>1</sup>H NMR (250 MHz, CDCl<sub>3</sub>) δ 0.84 (d, 6H), 0.92 (m, 6H), 1.39 (s, 18H), 2.08 (m, 2H), 4.15-4.50 (m, 6H), 4.99 (br d, 2H), 5.16 (m, 1H), 5.69 (s, 2H).

d) 2-*O*-iodomethoxycarbonyl-1,3-di-*O*-(*N*-tert-butoxycarbonyl-L-valyl)glycerol

A solution of 2-*O*-chloromethoxycarbonyl-1,3-di-*O*-(*N*-tert-butoxycarbonyl-L-valyl)propane-1,2,3-triol (7.86 g, 13.5 mmol) and NaI (8.09 g, 54.0 mmol) in 135 mL dry acetonitrile was refluxed at 80 °C for 4 h under N<sub>2</sub>. The reaction mixture was concentrated under vacuum, and then partitioned between 150 mL diethyl ether and 50 mL H<sub>2</sub>O. The aqueous layer was reextracted with 2 x 25 mL ether. The combined organic phases were washed successively with 25 mL aqueous Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> and 50 mL brine, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated. Flash column chromatography (silica gel, 2/1 hexane-ethyl acetate) gave 8.38 g (92%) title product (alternative name: 2-iodomethoxycarbonyloxy-1,3-bis-(*N*-tert-butoxycarbonyl-L-valyloxy)propane or 1,3-bis(*N*-tert-butoxycarbonyl-L-valyloxy)-2-propyl iodomethyl carbonate) as a white solid.

## c) 3-Benzyloxycarbonylpropionic acid iodomethyl ester

3-Benzyloxycarbonylpropionic acid chloromethyl ester (2 g, 1.38 mmole) was dissolved in acetonitrile (30 ml). Sodium iodide (1.6 g, 10.9 mmole) was added to  
30 the solution. After reaction at 70° C for 3 hr, the reaction mixture was filtered and the residue was dissolved in methylene chloride (20 ml) and refiltered. The solution was dried and gave intermediate 3-benzyloxycarbonylpropionic acid iodomethyl ester in quantitative yield. This intermediate is bonded to an accessible function of a drug,

such as a ring hydroxy or carboxy function using conventional alkylation/acylation conditions as described generally herein. Following deprotection of the terminal carboxy, a di/trifunctional linker bearing  $R_2$ , such as 1,3-bis- O-(L-valyl)glycerol or iodomethyloxy-L-valyl is acylated/alkylated thereon or  $R_2$  amide bonded thereon by conventional techniques as described herein, such as with DCC coupling agent.

20 Iodomethyl 2-methyl-2-(N-benzyloxycarbonyl-L-valyloxymethyl) propionate

a) 4-Methoxybenzyl 2-(hydroxymethyl)-2-methyl propionate.

2-(Hydroxymethyl)-2-methyl propionic acid was esterified by alkylation with 4-methoxybenzyl chloride by conventional means, namely treatment with aqueous NaOH, followed by evaporation and dissolution in an organic solvent such as DMF to which the 4-methoxybenzyl chloride is added and the reaction warmed and agitated, such as stirring at 60 C for one hour. The reaction mixture is cooled, concentrated by rotavapor and the resulting concentrated suspension partitioned between water and dichloromethane. The organic phase is evaporated and the residue subjected to silica gel column chromatography, for example with 0, 2, 4% EtOH in dichloromethane to yield the title compound (7.10 g). To a solution of 2,2-dimethyl-4-pentenoic acid (11.5 g, 90 mmol) in DMF (250 mL) at room temperature, was added potassium tert-butoxide (11.1 g, 99 mmol). The reaction mixture was stirred at 60 °C for 1h. 4-Methoxybenzyl chloride (16.9 g, 108 mmol) was added and the reaction mixture was stirred at 60 °C for 4h. The DMF was  
5 evaporated under vacuum, the residue was dissolved in ether (500 mL) and washed with water (3 x 200 mL). The organic phase was dried with  $\text{Na}_2\text{SO}_4$  and evaporated to give 21.4 g of 4-methoxybenzyl 2,2-dimethyl-4-pentenoate.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ): 7.27 (d,  $J = 8.7$  Hz, 2H), 6.88 (d,  $J = 8.7$  Hz, 2H), 5.8-5.6 (m, 1H), 5.1-4.9 (m, 2H), 5.03 (s, 2H), 3.80 (s, 3H), 2.27 (d, 2H), 1.17 (s, 6H).

b) 4-Methoxybenzyl 5-hydroxy-2,2-dimethylvalerate

A mixture of 4-methoxybenzyl 2,2-dimethyl-4-pentenoate (9.50 g, 38 mmol) and 9-  
15 BBN (115 mL, 57 mmol, 0.5 M in THF) was stirred at 60 °C for 60 min, whereupon the reaction mixture was cooled to -5 °C.  $\text{H}_2\text{O}$  (35 mL) was added, the reaction mixture was stirred for 5 min at -5 °C, an aqueous solution of NaOH (35 mL, 3M) was added and the reaction mixture was stirred for a further 10 min at -5 °C. An aqueous solution of  $\text{H}_2\text{O}_2$  (35 mL, 30%) was added dropwise and the temperature of  
20 the reaction mixture was allowed to assume room temperature, whereupon the reaction mixture was stirred for 30 min at room temperature. After evaporation, water (200 mL) was added and the resulting mixture was extracted with  $\text{CH}_2\text{Cl}_2$  (5 x 200 mL). The combined organic layers were dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated under reduced pressure. The crude product was column chromatographed (silica gel,  
25 1→8% MeOH in  $\text{CH}_2\text{Cl}_2$ ), to give 6.32 g of 4-methoxybenzyl 5-hydroxy-2,2-dimethylvalerate.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ): 7.27 (d,  $J = 8.5$  Hz, 2H), 6.87 (d,  $J = 8.5$  Hz, 2H), 5.03 (s, 2H), 3.79 (s, 3H), 3.53 (t, 2H), 1.88 (m, 1H), 1.61-1.52 (m, 2H), 1.49-1.38 (m, 2H), 1.16  
30 (s, 6H).

c) 4-Methoxybenzyl 5-(N-CBz-L-valyloxy)-2,2-dimethylvalerate

To a mixture of DCC (9.41 g, 46 mmol), DMAP (0.586 g, 4.8 mmol) and N-CBz-L-valine (12.1 g, 48 mmol) in  $\text{CH}_2\text{Cl}_2$  (200 mL) at 0 °C, was added dropwise a solution of 4-methoxybenzyl 5-hydroxy-2,2-dimethyl-valerate (6.40 g, 24 mmol) in  $\text{CH}_2\text{Cl}_2$  (50 mL). After 1h at 0 °C, the temperature of the reaction mixture was allowed to assume room temperature and then the mixture was stirred for 5h at room temperature. The mixture was filtered through a glass filter and the solvent was removed under reduced pressure. The crude product was column chromatographed (silica gel, 1→4% MeOH in  $\text{CH}_2\text{Cl}_2$ ), to give 8.61 g 4-methoxybenzyl 5-(N-CBz-L-valyloxy)-2,2-dimethylvalerate.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ): 7.36 (s, 5H), 7.28 (d,  $J = 8.6$  Hz, 2H), 6.89 (d,  $J = 8.6$  Hz, 2H), 5.39 (d, 1H), 5.12 (s, 2H), 5.05 (s, 2H), 4.30 (dd, 1H), 4.10-4.02 (m, 2H), 3.80 (s, 3H), 2.28-2.07 (m, 1H), 1.62-1.48 (m, 4H), 1.19 (s, 6H), 0.97 (d, 3H), 0.89 (d, 3H).

d) 5-(N-CBz-L-valyloxy)-2,2-dimethylvaleric acid

To a solution of 4-methoxybenzyl 5-(N-CBz-L-valyloxy)-2,2-dimethylvalerate (8.24 g, 16.5 mmol) in  $\text{CH}_2\text{Cl}_2$  (100 mL) at room temperature, was added trifluoroacetic acid (5 mL). After 1h at room temperature, the reaction mixture was concentrated under reduced pressure. The crude product was column chromatographed (silica gel, 3→5% MeOH in  $\text{CH}_2\text{Cl}_2$ ), to give 6.00 g of 5-(N-CBz-L-valyloxy)-2,2-dimethylvaleric acid. The compound can be activated and directly esterified to a drug or further modified as described below.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ): 10.94 (br s, 1H), 7.35 (s, 5H), 5.45 (d, 1H), 5.11 (s, 2H), 4.30 (dd, 1H), 4.21-4.00 (m, 2H), 2.28-2.07 (m, 1H), 1.68-1.51 (m, 4H), 1.21 (s, 6H), 0.97 (d, 3H), 0.89 (d, 3H).

e) Chloromethyl 5-(N-CBz-L-valyloxy)-2,2-dimethylvalerate

To a solution of 5-(N-CBz-L-valyloxy)-2,2-dimethylvaleric acid (5.88 g, 15.5 mmol) in dioxane (100 mL), was added dropwise a 40% aqueous solution of tetrabutylammonium hydroxide (10.1 g). After stirring for 5 min, the solution was evaporated to dryness through co-evaporation with dioxane and toluene. The residue was dissolved in dichloromethane (100 mL) and then chloriodomethane (11.3 mL, 155 mmol) was added and the solution was stirred for 6h at room temperature. The solution was concentrated under reduced pressure and the residue was shaken with hexane / ethyl acetate (1:1 v/v, 200 mL). The yellow crystalline solid was filtered off and the filtrate was washed with aqueous solution of sodium thiosulfate (0.1 M) and the filtered through anhydrous sodium sulfate and evaporated to dryness. The residue was column chromatographed (silica gel, 1-4% MeOH in CH<sub>2</sub>Cl<sub>2</sub>), to give 3.95 g of chloromethyl 5-(N-CBz-L-valyloxy)-2,2-dimethylvalerate.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 7.34 (s, 5H), 5.69 (s, 2H), 5.35 (d, 1H), 5.10 (s, 2H), 4.29 (dd, 1H), 4.20-4.00 (m, 2H), 2.24-2.06 (m, 1H), 1.65-1.50 (m, 4H), 1.20 (s, 6H), 0.96 (d, 3H), 0.88 (d, 3H).

f) Iodomethyl 5-(N-CBz-L-valyloxy)-2,2-dimethylvalerate

To a solution of chloromethyl 5-(N-CBz-L-valyloxy)-2,2-dimethylvalerate (3.85 g, 9 mmol) in acetonitrile (50 mL), was added sodium iodide (5.40 g, 36 mmol). The solution was stirred for 4 h at 60 °C. The resulting suspension was filtered and the filtrate was evaporated. The residue was dissolved in CH<sub>2</sub>Cl<sub>2</sub> and washed with aqueous sodium thiosulfate (0.1 M). The organic phase was dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated under reduced pressure. The crude product was column chromatographed (silica gel, 1% MeOH in CH<sub>2</sub>Cl<sub>2</sub>), to give 4.26 g of iodomethyl 5-(N-CBz-L-valyloxy)-2,2-dimethylvalerate

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 7.34 (s, 5H), 5.90 (s, 2H), 5.32 (d, 1H), 5.10 (s, 2H), 4.29 (dd, 1H), 4.18-4.02 (m, 2H), 2.26-2.08 (m, 1H), 1.65-1.50 (m, 4H), 1.17 (s, 6H), 0.97 (d, 3H), 0.89 (d, 3H).

## Example A-1-9

2-(N-CBz-L-valyloxy)-ethyl iodomethyl carbonate

5

## a) 2-(N-CBz-L-valyloxy)-ethanol

To a mixture of DCC (11.4 g, 55 mmol), DMAP (0.611 g, 5 mmol) and ethyleneglycol (55.8 mL, 1 mol) in  $\text{CH}_2\text{Cl}_2$  (300 mL) at 0 °C, was added dropwise a solution of N-CBz-L-valine (12.6 g, 50 mmol) in  $\text{CH}_2\text{Cl}_2$  (100 mL). After 1h at 0 °C, the temperature of the reaction mixture was allowed to assume room temperature and then the mixture was stirred for 5h at room temperature. The mixture was filtered through a glass filter and the solvent was removed under reduced pressure. The crude product was column chromatographed (silica gel, 5→10% MeOH in  $\text{CH}_2\text{Cl}_2$ ), to give 12.0 g 2-(N-CBz-L-valyloxy)-ethanol.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ): 7.30 (s, 5H), 5.77 (d, 1H), 5.06 (s, 2H), 4.29-4.12 (m, 3H), 3.80-3.66 (m, 2H), 3.46 (m, 1H), 2.22-2.04 (m, 1H), 0.94 (d, 3H), 0.88 (d, 3H).

## b) 2-(N-CBz-L-valyloxy)-ethyl chloromethyl carbonate

To a mixture of 2-(N-CBz-L-valyloxy)-ethanol (12.0 g, 40.6 mmol) and pyridine (19.7 mL, 0.24 mmol) in  $\text{CH}_2\text{Cl}_2$  (300 mL) at 0 °C, was added dropwise chloromethyl chloroformate (10.5 g, 81.2 mmol). After 30 min at 0 °C, the reaction mixture was washed with  $\text{H}_2\text{O}$  (200 mL). The  $\text{H}_2\text{O}$  phase was washed with  $\text{CH}_2\text{Cl}_2$  (100 mL) and the solvent of the combined organic phases was removed under reduced pressure. The crude product was column chromatographed (silica gel, 0.5→1% MeOH in  $\text{CH}_2\text{Cl}_2$ ), to give 8.26 g 2-(N-CBz-L-valyloxy)-ethyl chloromethyl carbonate.

30

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 7.35 (s, 5H), 5.71 (s, 1H), 5.28 (d, 1H), 5.11 (s, 2H), 4.48-4.26 (m, 5H) 2.28-2.10 (m, 1H), 0.97 (d, 3H), 0.89 (d, 3H).

c) 2-(N-CBz-L-valyloxy)-ethyl iodomethyl carbonate

5

To a solution of 2-(N-CBz-L-valyloxy)-ethyl chloromethyl carbonate (3.88 g, 10 mmol) in acetonitrile (50 mL), was added sodium iodide (7.50 g, 50 mmol). The solution was stirred for 4 h at 60 °C. The resulting suspension was filtered and the filtrate was evaporated. The residue was dissolved in CH<sub>2</sub>Cl<sub>2</sub> and washed with  
10 aqueous sodium thiosulfate (0.1 M). The organic phase was dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated under reduced pressure, to give 4.51 g 2-(N-CBz-L-valyloxy)-ethyl iodomethyl carbonate.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 7.34 (s, 5H), 5.93 (s, 2H), 5.26 (d, 1H), 5.11 (s, 2H), 4.48-4.26  
15 (m, 5H) 2.28-2.10 (m, 1H), 0.97 (d, 3H), 0.90 (d, 3H).

2,2-dimethyl-3-(N-CBz-D-valyloxy)-propionic acid iodomethyl ester

20

a) 2,2-dimethyl-3-(N-CBz-D-valyloxy)-propionic acid

25 To a solution of 2,2-dimethyl propionic acid 4-methoxybenzyl ester (4.7 g, 20 mmole) and N-CBz-D-valine (5.5 g, 22 mmole) in dichloromethane (100 ml) were added 4-dimethylaminopyridine (305 mg, 2.5 mmole) and DCC (5.15 g, 25 mmole). After 18 hr, the solution was washed successively with sodium bicarbonate aqueous solution, citric acid solution and water. The organic phase was dried and the residue  
30 was dissolved in dichloromethane (100 ml). To the solution was added trifluoroacetic

acid (10 ml). After 3 hr, it was evaporated and the product was isolated with silica gel column chromatography. 4.5 g. The compound may be activated and esterified to a drug or further modified as described below.

5 <sup>1</sup>H-NMR (CDCl<sub>3</sub>): 7.36 (m, 5 H) 5.11 (s, 2H) 4.30 (m, 1H) 4.18 (dd, 2H) 2.17 (m, 1H), 1.23 (d, 6 H) 0.93 (m, 6H).

b) 2,2-dimethyl-3- ( N-CBz-D-Valyloxy )-propionic acid chloromethyl ester

10

(2,2-dimethyl-3-(N-CBz-D-valyloxy)-propionic acid (4.5 g, 12.8 mmole) was dissolved in dioxane (20 ml). To the solution was added tetrabutylammonium hydroxide aqueous solution (40 %, 8.3 ml, 12.8 mmole). The solution was dried in vacuo, and it was coevaporated with toluene several times. The residue was dissolved  
15 in methylene chloride and then chloriodomethane (18 ml, 260 mmole) was added to the solution. After 18 hr, the reaction solution was evaporated and the product was isolated with silica gel column chromatography. 3.5 g.

5

## a) 4-(N-CBz-L-valyloxy) butyric acid t-butyl ester

N-CBz-L-valine (16.25 g, 65 mmole) was dissolved in DMF (40 ml). To the solution was added potassium t-butoxide (7.24 g, 65 mmole). After 10 min, 4-bromobutyric acid t-butyl ester (12 g, 53 mmole) was added. The reaction mixture was kept at 65° C for 2.5 hr and then poured into sodium bicarbonate aqueous solution and extracted with dichloromethane. The organic phase was dried and the product was isolated with silica gel column chromatography. 20.1 g.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 7.38 (m, 5H) 5.32 (d, 1H) 5.13 (s, 2H) 4.32 (dd, 1H) 4.28 (t, 2H) 2.31 (t, 2H) 2.18 (m, 1H) 1.97 (m, 2H) 1.45 (s, 9 H) 0.97 (m, 6 H).

## b) 4-(N-CBz-L-valyloxy)butyric acid chloromethyl ester

4-(N-CBz-L-valyloxy) butyric acid t-butyl ester (20 g, 50.8 mmole) was treated with trifluoroacetic acid (30 ml) at 0° C for 3 h and then evaporated. The residue was coevaporated with toluene several time. The intermediate acid (2.56 g, 7.6 mmole) was dissolved in dioxane (10 ml) and to the solution was added tetrabutylammonium hydroxide (40 %, 4.66 ml, 7.2 mmole). The solution was dried and dissolved in dichloromethane (20 ml) and then chloriodomethane (10 ml, 144 mmole) was added to the solution. After 18 hr, the reaction solution was evaporated and the product was isolated with silica gel column chromatography. Yield 2.1 g.

hydroxide (10.43g, 16.08 mmole) and the mixture was stirred 2 hours at room temperature. The mixture was evaporated under reduced pressure and co-evaporated two times with 1,4-dioxane and two times with toluene. The dried product was dissolved in 40 ml dichloromethane and chloriodomethane (28.4g, 160 mmole) was added. The solution was stirred for two days at room temperature and evaporated under reduced pressure. Ethyl acetate (100 ml) was added and the organic phase washed twice with water, dried with sodium sulfate and evaporated under reduced pressure. The product was isolated by silica gel column chromatography. Yield: 2.2g = 35%

1,3-bis(N-tert-butoxycarbonyl-L-valyloxy)-2-propyl 1-iodoethyl carbonate

M132US-1

(a) 1,3-bis(*N*-tert-butoxycarbonyl-L-valyloxy)-2-propyl 1-chloroethyl carbonate

To a solution of 1,3-bis(*N*-tert-butoxycarbonyl-L-valyloxy)-2-propanol (0.545 g, 1.11 mmol) in 5 mL dry CH<sub>2</sub>Cl<sub>2</sub> were added pyridine (540 μL, 6.68 mmol), with cooling and stirring in an ice bath, followed by 1-chloroethyl chloroformate (242 μL, 2.22 mmol). After 1 h, the reaction mixture was diluted with 5 mL CH<sub>2</sub>Cl<sub>2</sub> and washed with water (5 mL) and brine (5 mL). The organic phase was dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentrated on a rotavapor, coevaporating several times with toluene. Column chromatography (silica, 4/1 petroleum ether - ethyl acetate) gave the chloride (596 mg, 90%) as a white solid.

<sup>1</sup>H NMR (250 MHz, CDCl<sub>3</sub>) δ 0.77 and 0.83 (2d, 6H each, *J* = 6.8 Hz), 1.31 (s, 18H), 1.70 (d, 3H, *J* = 5.8 Hz), 2.00 (m, 2H), 4.08-4.41 (m, 6H), 5.01-5.09 (m, 3H), 6.30 (q, 1H, *J* = 5.7 Hz).

(b) 1,3-bis(*N*-tert-butoxycarbonyl-L-valyloxy)-2-propyl 1-iodoethyl carbonate

A mixture of the chloride (596 mg, 1.0 mmol) from step (a) and NaI (684 mg, 4.57 mmol) in 10 mL dry MeCN was refluxed at 80 °C for 4 h. The reaction mixture was concentrated under vacuum and then partitioned between 30 mL diethyl ether and 10 mL water. The organic phase was washed with 5% aqueous sodium thiosulfate (2 x 5 mL), and the last aqueous layer was reextracted with ether (5 mL). The organic phases were combined, washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated.

Flash column chromatography (silica, 4/1 petroleum ether – ethyl acetate) gave a fraction (275 mg) containing 80% iodide, as determined from  $^1\text{H}$  NMR, and small amounts of the starting chloride and alkene from the elimination side reaction.

$^1\text{H}$  NMR (250 MHz,  $\text{CDCl}_3$ )  $\delta$  0.81-0.85 (m, 6H), 0.88-0.92 (m, 6H), 1.37 (s, 18H),

(b) 3-(*N*-benzyloxycarbonyl-L-valyloxy)-2,2-dimethylpropyl chloromethyl carbonate

Chloromethyl chloroformate (1.50 mL, 16.6 mmol) was added to a solution of the alcohol (2.74 g, 8.12 mmol) from step (a) and pyridine (4.9 mL, 61 mmol) in 40 mL dry CH<sub>2</sub>Cl<sub>2</sub>, in an ice bath. After stirring for 1 h, the mixture was diluted with CH<sub>2</sub>Cl<sub>2</sub> and washed successively with water, saturated NaHCO<sub>3</sub>, and brine. The organic phase was dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentrated, coevaporating several times with toluene on a rotavapor. Flash column chromatography (silica, 2/1 petroleum ether – ethyl acetate) gave 3.31 g (95%) of the title compound.

(c) 3-(*N*-benzyloxycarbonyl-L-valyloxy)-2,2-dimethylpropyl iodomethyl carbonate

A mixture of the chloride (3.14 g, 7.30 mmol) from step (b) and NaI (4.37 g, 29.2 mmol) in 73 mL dry MeCN was refluxed at 80 °C for 3 h. After removal of solvent under vacuum, the mixture was partitioned between 80 mL ethyl acetate and 40 mL water. The organic phase was washed with 5% Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>, and then brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, and concentrated. Flash column chromatography (silica, petroleum ether – ethyl acetate) gave 3.68 g (97%) of the title compound.

(b) 1-(*N*-benzyloxycarbonyl-L-valyloxy)-2-methyl-2-propyl chloromethyl carbonate

All of the alcohol from above was dissolved in 35 mL dry CH<sub>2</sub>Cl<sub>2</sub> and cooled in an ice bath. Pyridine (3.50 mL, 43.4 mmol) was added, followed by chloromethyl  
 20 chloroformate (1.30 mL, 14.4 mmol). After 1 h, the ice bath was removed and stirring was continued for 2 h at ambient temperature. The mixture was diluted with CH<sub>2</sub>Cl<sub>2</sub> (50 mL) and washed with water (50 mL), and then brine (2 x 25 mL). Drying over anhydrous Na<sub>2</sub>SO<sub>4</sub> of the combined organic phases and concentration under vacuum, coevaporating several times with toluene, gave a yellow-brown oil that was

subjected to flash column chromatography (silica, 2/1 petroleum ether – ethyl acetate) to yield 2.86 g (86% from *N*-benzyloxycarbonyl-L-valine) of the title compound.

<sup>1</sup>H NMR (250 MHz, CDCl<sub>3</sub>) δ 0.90 and 0.98 (2d, 3H each, *J* = 6.9 Hz), 1.53 (s, 6H),

Iodomethyl 3,4-di-(*N*-CBZ-L-valyloxy)hydrocinnamate

10015184-11601

a) 4-Methoxybenzyl-3,4-dihydroxyhydrocinnamate

3,4-Dihydroxycinnamic acid (6.5 g, 35.7 mmol) was dissolved in DMF (50 ml) and  
 5 cooled to 0°C on an ice-bath. 4-Potassium tert-butoxide (35.7 mmol), was then added  
 and the mixture was left for approximately 30 min at 0°C, followed by dropwise  
 addition of 4-methoxy-benzylchloride (39 mmol) in DMF (25 ml). The mixture was  
 allowed to reach room temperature and left over-night. The solvent was then  
 evaporated and the crude product was purified by chromatography (ethyl acetate-  
 10 hexane, 1:1) to give 6 g of the title compound (55%).

<sup>1</sup>H NMR (CDCl<sub>3</sub>, 45 °C): 7.24-6.57 (m, 7H), 5.03 (s, 2H), 3.80 (s, 3H), 2.83 (t, 2H),  
 2.58 (t, 3H).

15 b) 4-Methoxybenzyl-3,4-di-(N-CBZ-L-valyloxy)hydrocinnamate

4-Methoxybenzyl-3,4-dihydroxyhydrocinnamate (5 g, 16.5 mmol), *N,N*-  
 dimethylaminopyridine (2g, 16.5 mmol), *N,N'*- dicyclohexyl carbodiimide (8.5 g,  
 41.3 mmol) and Cbz-L-valine (10.4 g, 41.3 mmol) were dissolved in  
 20 dichloromethane (50 ml). After 4 h, the the mixture was filtered and evaporated onto  
 silica gel and purified by chromatography (hexane-EtOAc, 5:2 → 3:2) to give pure  
 title product (10.1 g, 79 %).

<sup>1</sup>H NMR (CDCl<sub>3</sub>, 45 °C): 7.24-6.49 (m, 17 H), 5.6 (br s, 2H), 5.0 (m, 6H) , 4.45 (m,

c) 3,4-Di-(N-CBZ-L-valyloxy)hydrocinnamic acid

4-Methoxybenzyl-3,4-di-(N-CBZ-L-valyloxy)hydrocinnamate (10 g, 13 mmol) was dissolved in dichloromethane and 1,1,1 trifluoroacetic acid (30 ml) and left at ambient temperature for 3.5 h. Evaporation under reduced pressure and purification  
5 by chromatography (chloroform-methanol, 10:1) yielded 6.7 g (80%) pure title product. The compound can be activated and esterified to a drug or further modified as described below.

<sup>1</sup>H NMR (CDCl<sub>3</sub>, 45 °C): 7.24-7.0 (m, 13H), 5.65 (br s, 1H), 5.55 (br s, 1H), 5.1 (m,

d) Chloromethyl 3,4-di-(N-CBZ-L-valyloxy)hydrocinnamate

3,4-Di-(N-CBZ-L-valyloxy)hydrocinnamic acid (4.2 g, 6.47 mmol) was dissolved in  
15 dioxane (70 ml). Tetrabutylammonium hydroxide was added dropwise until pH=8. The solvent was then removed under reduced pressure. The solid was redissolved in dioxane (30 ml) and toluene (30 ml) and evaporated. The procedure was repeated twice (for removal of water). Dichloromethane (60 ml) and chloro-iodomethane was  
20 added in one portion and the mixture was left at ambient temperature for 6 h. Evaporation of the solvent and purification by chromatography yielded 1.7 g title product (38%).

<sup>1</sup>H NMR (CDCl<sub>3</sub>, 45 °C): 7.3-7.0 (m, 13H), 5.67 (s, 2H), 5.62 (br s, 2H), 5.14-5.0 (m,  
25 4H), 4.46 (m, 2H), 2.95 (t, 2H), 2.67 (m, 2H), 1.07-0.99 (m, 12H)

e) Iodomethyl 3,4-di-(N-CBZ-L-valyloxy)hydrocinnamate

Chloromethyl 3,4-di-(N-CBZ-L-valyloxy)hydrocinnamate (1.9 g, 2.7 mmol) and sodium iodide (2 g, 13.3 mmol) were dissolved in acetonitrile (50 ml) and heated to  
30 65° C for 60 min. The solvent was removed under reduced pressure and the residue was taken up in dichloromethane and filtrated. Removal of the solvent and purification by chromatography (ethyl acetate-hexane, 2:5) gave pure title product (1.9 g, 90 %)

<sup>1</sup>H NMR (CDCl<sub>3</sub>, 45 °C): 7.34-7.02 (m, 13H), 5.89 (s, 2H), 5.64 (br s, 2H), 5.14-5.02 (m, 4H), 4.47 (m, 2H), 2.96 (t, 2H), 2.64 (t, 2H), 2.33 (m, 2H), 1.08-0.99 (m, 12H)

Iodomethyl 4-(2-N-benzyloxycarbonyl-L-valyloxyethyl) benzoate

a) 4-(2-N-benzyloxycarbonyl-L-valyloxyethyl)-toluene

To a cooled solution of 4-methylphenylethanol-2 (5.0g, 36.7 mmole), 4-  
dimethylaminopyridine (0.98g, 8 mmole) and N-benzyloxycarbonyl-L-valine

(10.05g, 40 mmole) in dichloromethane (120 ml) was added dicyclohexylcarbodiimide (9.1g, 44 mmole) and the mixture was stirred overnight at room temperature. The mixture was cooled and the urethane was filtered. The solution was evaporated under reduced pressure and ethyl acetate (250 ml) was added. The organic phase was washed twice with 5% acetic acid, 5% sodium hydrogencarbonate and water. The organic phase was dried with sodium sulfate and evaporated under reduced pressure. The product was isolated by silica gel column chromatography with toluene/acetone. Yield: 13.3g = 97%

c) Chloromethyl 4-(2-N-benzyloxycarbonyl-L-valyloxyethyl)benzoate

To a solution of 4-(2-N-benzyloxycarbonyl-L-valyloxyethyl)benzoic acid (2.0g, 5.0 mmole) in 1,4-dioxane (20 ml) was added a 40% solution of tetrabutylammonium

hydroxide (3.1g, 4.75 mmole) and the mixture was stirred 2 hours at room temperature. The mixture was evaporated under reduced pressure and coevaporated two times with 1,4-dioxane and two times with toluene. The dried product was dissolved in dichloromethane (10 ml) and iodochloromethane (13.2g, 75 mmole) was added. The solution was stirred overnight at room temperature and evaporated under reduced pressure. About 50 ml ethyl acetate were added and the organic phase washed twice with water, dried with sodium sulfate and evaporated under reduced pressure. The product was isolated by silica gel column chromatography. Yield: 0.5g = 23%

c) Chloromethyl 2-(N-benzyloxycarbonyl-L-isoleucyloxy)-2-methyl propionate.

10015184-111601

To a solution of 2-(N-benzyloxycarbonyl-L-isoleucyloxymethyl)-2-methyl propionic acid (7.0g, 19 mmole) in 80 ml 1,4-dioxane was added a 40% solution of tetrabutylammonium hydroxide (12.4g, 19 mmole) and the mixture was stirred 2 hours at room temperature. The mixture was evaporated under reduced pressure and co-evaporated two times with 1,4-dioxane and two times with toluene. The dried product was dissolved in 25 ml dichloromethane and iodochloromethane (33.7g, 190 mmole) was added. The solution was stirred overnight at room temperature and evaporated under reduced pressure. About 100 ml ethyl acetate was added and the organic phase washed twice with water, dried with sodium sulfate and evaporated under reduced pressure. The product was isolated by silica gel column chromatography with toluene/acetone. Yield: 4.2 g = 54%

To a cooled solution of 2-(N-(tert.-butoxycarbonyl)-amino)-2-methylpropan-1-ol (J. Am. Chem. Soc 113 (1991) p 8883) (4.73g, 25 mmole), 4-dimethylamino-pyridine (0.61g, 5 mmole) and N-benzyloxycarbonyl-L-valine (6.28g, 25 mmole) in dichloromethane (70 ml) was added dicyclohexyl-carbodiimide (6.19g, 30 mmole) and the mixture was stirred 2 days at room temperature. The mixture was cooled, the urethane was filtered and the solution evaporated under reduced pressure. Ethyl acetate (200 ml) was added and the organic phase was washed twice with 5% acetic acid, 5% sodium hydrogencarbonate and water. The organic phase was dried with sodium sulfate and evaporated under reduced pressure. The product was isolated by silica gel column chromatography with hexane/ethyl acetate. Yield: 10.2g = 96%.

b) 2-amino-2-methyl-1-(N-benzyloxycarbonyl-L-valyloxy)-propane.

To a solution of 2-(N-(tert.-butoxycarbonyl)-amino)-2-methyl-1-(N-benzyloxycarbonyl-L-valyloxy)-propane (10g, 23 mmole) in dichloromethane (150 ml) was added trifluoroacetic acid (30 ml) and the mixture was stirred for 1 hour at room temperature. The solution was evaporated under reduced pressure and 10% sodium carbonate solution was added. The product was extracted four times with dichloromethane, dried with sodium sulfate and evaporated under reduced pressure. The product was isolated by silica gel column chromatography with dichloromethane/methanol. Yield: 3.0g = 40% (crude)

c) 2-(N-(chloromethoxycarbonyl)-amino)-2-methyl-1-(N-benzyloxycarbonyl-L-

valyloxy)-propane.

To a solution of 2-amino-2-methyl-1-(N-benzyloxycarbonyl-L-valyloxy)-propane (2.9g, 9 mmole) and pyridine (2 ml) in dichloromethane (50 ml) was added chloromethyl chloroformate (1.55g, 12 mmole) and the mixture was stirred for 3

hours at room temperature. The mixture was evaporated under reduced pressure and ethyl acetate was added. The organic phase was washed with water, dried with sodium sulfate and evaporated under reduced pressure. The product was isolated by silica gel column chromatography with hexane/ethyl acetate. Yield: 1.1g = 29%.

M132US-1

a) 6-oxo-1,6-dihydro-pyridine-3-carboxylic acid 4-methoxybenzyl ester

- 5 To a solution of 6-hydroxynicotinic acid (4.87 g, 35 mmol) in DMF (100 mL) at room temperature, was added potassium tert-butoxide (3.93 g, 35 mmol). The reaction mixture was stirred at 60 °C for 1h. 4-Methoxybenzylchloride (8.30 g, 53 mmol) was added and the reaction mixture was stirred at 60 °C for 4h. The DMF was evaporated under vacuum, the residue was dissolved in ether (200 mL) and washed  
10 with water (3 x 100 mL). The organic phase was dried with Na<sub>2</sub>SO<sub>4</sub> and evaporated to give 4.41 g of 6-oxo-1,6-dihydro-pyridine-3-carboxylic acid 4-methoxybenzyl ester.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 8.20 (d, *J* = 2.5 Hz, 1H), 8.01 (dd, *J* = 9.5, 2.5 Hz, 1H), 7.33 (d, *J* = 8.7 Hz, 2H), 6.90 (d, *J* = 8.7 Hz, 2H), 6.54 (d, *J* = 9.5 Hz, 1H), 5.22 (s, 2H),  
15 3.81 (s, 3H).

b) 1-(2-Hydroxyethyl)-6-oxo-1,6-dihydro-pyridine-3-carboxylic acid 4-methoxybenzyl ester

20

To a solution of 6-oxo-1,6-dihydro-pyridine-3-carboxylic acid 4-methoxybenzyl ester (4.41 g, 17 mmol) and K<sub>2</sub>CO<sub>3</sub> (2.58 g, 18.7 mmol) in DMF (100 mL) at room temperature, was added 2-bromoethanol (2.02 g, 16.2 mmol). The reaction mixture was stirred at 80 °C for 30h, whereupon the DMF was evaporated under vacuum.

- 25 The crude product was column chromatographed (silica gel, 2→5% MeOH in CH<sub>2</sub>Cl<sub>2</sub>), to give 3.91 g of 1-(2-hydroxyethyl)-6-oxo-1,6-dihydro-pyridine-3-carboxylic acid 4-methoxybenzyl ester.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 8.26 (d, *J* = 2.5 Hz, 1H), 7.85 (dd, *J* = 9.5, 2.5 Hz, 1H), 7.34 (d, *J* = 8.7 Hz, 2H), 6.90 (d, *J* = 8.7 Hz, 2H), 6.47 (d, *J* = 9.5 Hz, 1H), 5.21 (s, 2H), 4.09 (t, 2H), 3.90 (m, 2H), 3.81 (s, 3H), 3.64 (br s, 1H).

c) 1-(2-N-CBz-L-valyloxyethyl)-6-oxo-1,6-dihydro-pyridine-3-carboxylic acid 4-methoxybenzyl ester

10 To a mixture of DCC (5.06 g, 24.5 mmol), DMAP (318 mg, 2.6 mmol) and N-CBz-L-valine (6.48 g, 25.8 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (200 mL) at 0 °C, was added dropwise a solution of 1-(2-hydroxyethyl)-6-oxo-1,6-dihydro-pyridine-3-carboxylic acid 4-methoxybenzyl ester (6.40 g, 24 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (200 mL). After 1 h at 0 °C, the temperature of the reaction mixture was allowed to assume room temperature and  
15 then the mixture was stirred for 5 h at room temperature. The mixture was filtered through a glass filter and the solvent was removed under reduced pressure. The crude product was column chromatographed (silica gel, 2→5% MeOH in CH<sub>2</sub>Cl<sub>2</sub>), to give 6.81 g 1-(2-N-CBz-L-valyloxyethyl)-6-oxo-1,6-dihydro-pyridine-3-carboxylic acid 4-methoxybenzyl ester.

20

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 8.15 (d, *J* = 2.5 Hz, 1H), 7.83 (dd, *J* = 9.6, 2.5 Hz, 1H), 7.37-7.25 (m, 7H), 6.88 (d, 2H), 6.49 (d, *J* = 9.6 Hz, 1H), 5.35 (d, 1H), 5.21 (s, 2H), 5.06 (s, 2H), 4.48-4.05 (m, 5H), 3.78 (s, 3H), 2.10-1.98 (m, 1H), 0.85 (d, 3H), 0.75 (d, 3H).

25 d) 1-(2-N-CBz-L-valyloxyethyl)-2-pyridone-5-carboxylic acid

To a solution of 1-(2-N-CBz-L-valyloxyethyl)-6-oxo-1,6-dihydro-pyridine-3-carboxylic acid 4-methoxybenzyl ester (6.46 g, 12 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (85 mL) at room temperature, was added trifluoroacetic acid (15 mL). After 1 h at room temperature,  
30 the reaction mixture was concentrated under reduced pressure. The crude product was column chromatographed (silica gel, 3→6% MeOH in CH<sub>2</sub>Cl<sub>2</sub>), to give 4.91 g 1-

(2-N-CBz-L-valyloxyethyl)-2-pyridone-5-carboxylic acid. The product can be activated and esterified direct to a drug or further modified as described below.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 12.15 (br s, 1H), 8.29 (d, *J* = 2.2 Hz, 1H), 7.93 (dd, *J* = 9.5, 2.2 Hz, 1H), 7.31 (m, 5H), 6.69 (d, *J* = 9.5 Hz, 1H), 5.53 (d, 1H), 5.07 (s, 2H), 4.52-4.05 (m, 5H), 2.20-2.00 (m, 1H), 0.90 (d, 3H), 0.81 (d, 3H).

e) 1-(2-N-CBz-L-valyloxyethyl)-6-oxo-1,6-dihydro-pyridine-3-carboxylic acid chloromethyl ester

10

To a solution of 1-(2-N-CBz-L-valyloxyethyl)-2-pyridone-5-carboxylic acid (4.91 g, 11.8 mmol) in dioxane (200 mL), was added dropwise a 40% aqueous solution of tetrabutylammonium hydroxide (7.65 g). After stirring for 5 min, the solution was evaporated to dryness through co-evaporation with dioxane and toluene. The residue was dissolved in dichloromethane (200 mL) and then chloriodomethane (8.74 mL, 120 mmol) was added and the solution was stirred for 12h at room temperature. The solution was concentrated under reduced pressure and the residue was shaken with hexane / ethyl acetate (1:1 v/v, 200 mL). The yellow crystalline solid was filtered off and the filtrate was washed with aqueous solution of sodium thiosulfate (0.1 M) and the filtered through anhydrous sodium sulfate and evaporated to dryness. The residue was column chromatographed (silica gel, 2-4% MeOH in CH<sub>2</sub>Cl<sub>2</sub>), to give 1.80 g of 1-(2-N-CBz-L-valyloxyethyl)-6-oxo-1,6-dihydro-pyridine-3-carboxylic acid chloromethyl ester.

25 <sup>1</sup>H-NMR (CDCl<sub>3</sub>): 8.24 (d, *J* = 2.5 Hz, 1H), 7.83 (dd, *J* = 9.6, 2.5 Hz, 1H), 7.33 (m, 5H), 6.54 (d, *J* = 9.6 Hz, 1H), 5.86 (s, 2H), 5.34 (d, 1H), 5.09 (s, 2H), 4.56-4.08 (m, 5H), 2.20-2.00 (m, 1H), 0.92 (d, 3H), 0.83 (d, 3H).

f) 1-(2-N-CBz-L-valyloxyethyl)-6-oxo-1,6-dihydro-pyridine-3-carboxylic acid iodomethyl ester

30

To a solution of 1-(2-N-CBz-L-valyloxyethyl)-6-oxo-1,6-dihydro-pyridine-3-carboxylic acid chloromethyl ester (1.80 g, 3.87 mmol) in acetonitrile (30 mL), was

added sodium iodide (2.32 g, 15.5 mmol). The solution was stirred for 4 h at 60 °C. The resulting suspension was filtered and the filtrate was evaporated. The residue was dissolved in CH<sub>2</sub>Cl<sub>2</sub> and washed with aqueous sodium thiosulfate (0.1 M). The organic phase was dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated under reduced pressure. The crude product was column chromatographed (silica gel, 1% MeOH in CH<sub>2</sub>Cl<sub>2</sub>), to give 2.04 g 1-(2-N-CBz-L-valyloxyethyl)-6-oxo-1,6-dihydro-pyridine-3-carboxylic acid iodomethyl ester.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 8.19 (d, *J* = 2.5 Hz, 1H), 7.79 (dd, *J* = 9.6, 2.5 Hz, 1H), 7.32 (m, 5H), 6.52 (d, *J* = 9.6 Hz, 1H), 6.04 (s, 2H), 5.38 (d, 1H), 5.07 (s, 2H), 4.54-4.06 (m, 5H), 2.20-2.00 (m, 1H), 0.91 (d, 3H), 0.81 (d, 3H).

##### Iodomethyl 5-[(*N*-benzyloxycarbonyl-L-valyloxy)methyl]-2-furoate

##### (a) 5-[(*N*-Benzyloxycarbonyl-L-valyloxy)methyl]-2-furaldehyde

A solution of 5-(hydroxymethyl)-2-furaldehyde (1.00 g, 7.69 mmol) in 5 mL dry CH<sub>2</sub>Cl<sub>2</sub> was added to a mixture of *N*-benzyloxycarbonyl-L-valine (2.40 g, 9.57 mmol), *N,N'*-dicyclohexylcarbodiimide (2.00 g, 9.69 mmol), and 4-dimethylaminopyridine (117 mg, 0.96 mmol) in 45 mL CH<sub>2</sub>Cl<sub>2</sub>. After stirring overnight, the reaction slurry was filtered, concentrated under vacuum, and subjected to flash column chromatography (silica, 2/1 petroleum ether - ethyl acetate to give the valine ester (quantitative yield).

<sup>1</sup>H NMR (250 MHz, CDCl<sub>3</sub>) δ 0.86 and 0.94 (2d, 3H each, *J* = 6.9 Hz), 2.16 (m, 1H), 4.34 (dd, 1H, *J* = 9.0, 4.7 Hz), 5.10 (s, 2H), 5.13-5.27 (m, 3H), 6.59 (d, 1H, *J* = 3.4 Hz), 7.19 (d, 1H, *J* = 3.5 Hz), 7.35 (s, 5H), 9.63 (s, 1H).

(b) 5-[(*N*-Benzyloxycarbonyl-L-valyloxy)methyl]-2-furoic acid

- 5 A solution of NaClO<sub>2</sub> (2.8 mmol) in 3 mL water was added dropwise to a stirred solution of 5-[(*N*-benzyloxycarbonyl-L-valyloxy)methyl]-2-furaldehyde (798 mg, 2.22 mmol) from step (a) in 3 mL MeCN, with cooling in an ice bath. After 2.5 h, the ice bath was removed, 2 mL more MeCN was added, and the two-phase liquid reaction mixture was stirred at room temperature for 25 h. The reaction mixture was
- 10 diluted with water, made basic with saturated NaHCO<sub>3</sub>, and extracted with ethyl acetate (3 x 50 mL). The separated aqueous solution was acidified to pH 2 with 5% aqueous HCl and extracted with ethyl acetate (3 x 50 mL). This second ethyl acetate solution was washed with brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, and evaporated to dryness under vacuum to give the carboxylic acid (287 mg, 34%) which was used in
- 15 the next step without further purification. The compound can be activated and esterified direct to a drug or further modified as described below.

<sup>1</sup>H NMR (250 MHz, CDCl<sub>3</sub>) δ 0.84 and 0.93 (2d, 3H each, *J* = 6.8 Hz), 2.15 (m, 1H), 4.35 (dd, 1H, *J* = 9.0, 4.7 Hz), 5.10-5.24 (m, 4H), 5.44 (d, 1H, *J* = 9.0 Hz), 6.54 (d, 1H, *J* = 3.3 Hz), 7.23 (d, 1H, *J* = 3.3 Hz), 7.33 (s, 5H), 11.05 (br s, 1H).

20 (c) Chloromethyl 5-[(*N*-benzyloxycarbonyl-L-valyloxy)methyl]-2-furoate

- Tetrabutylammonium hydroxide (40 wt. % solution in water, 0.55 mL, 0.84 mmol) was added to the carboxylic acid (286 mg, 0.76 mmol) from step (b) in 5 mL dioxane. The yellow solution was concentrated under vacuum, coevaporating several times with dioxane, toluene, and, lastly, CH<sub>2</sub>Cl<sub>2</sub>. The residue was charged with 10
- 25 mL dry CH<sub>2</sub>Cl<sub>2</sub> and chloriodomethane (0.55 mL, 7.55 mmol) was added. After stirring for 20.5 h, the reaction mixture was concentrated and subjected to flash

column chromatography (silica, 2/1 petroleum ether - ethyl acetate) to give the chloromethyl ester (137 mg, 42%).

<sup>1</sup>H NMR (250 MHz, CDCl<sub>3</sub>) δ 0.85 and 0.93 (2d, 3H each, *J* = 6.9 Hz), 2.14 (m, 1H), 4.33 (dd, 1H, *J* = 9.0, 4.8 Hz), 5.09-5.22 (m, 4H), 5.37 (d, 1H, *J* = 8.9 Hz), 5.88 (s, 2H), 6.53 (d, 1H, *J* = 3.4 Hz), 7.23 (d, 1H, *J* = 3.5 Hz), 7.32 (s, 5H).

(d) Iodomethyl 5-[(*N*-benzyloxycarbonyl-*L*-valyloxy)methyl]-2-furoate

All of the chloromethyl ester (137 mg, 0.32 mmol) from step (c) was refluxed with NaI (195 mg, 1.3 mmol) in 3.2 mL dry MeCN at 70 °C for 4 h. The solvent was removed under vacuum and the residue was subjected to flash column chromatography (silica, 3/1 petroleum ether - ethyl acetate) to give the iodomethyl ester (152 mg, 92%).

<sup>1</sup>H NMR (250 MHz, CDCl<sub>3</sub>) δ 0.84 and 0.93 (2d, 3H each, *J* = 6.8 Hz), 2.16 (m, 1H), 4.33 (dd, 1H, *J* = 9.1, 4.7 Hz), 5.09-5.21 (m, 4H), 5.36 (d, 1H, *J* = 9.1 Hz), 6.08 (s, 2H), 6.52 (d, 1H, *J* = 3.4 Hz), 7.19 (d, 1H, *J* = 3.5 Hz), 7.33 (s, 5H).

Example A-I-27

4-(2-*N*-benzyloxycarbonyl-*L*-valyloxyethyl)benzoic acid.

a) 4-Methoxybenzyl 4-(2-hydroxyethoxy)benzoate

To a solution of 4-methoxybenzyl 4-hydroxybenzoate (7.0g, 27 mmole) in dry *N,N*-dimethylformamide (50 ml) was added potassium carbonate (4.15g, 30 mmole) and 2-bromoethanol. The mixture was stirred 48 hours at 80°C, evaporated under reduced pressure and ethyl acetate and water were added. The organic phase was washed five times with water and dried with sodium

sulfate. The solution was evaporated under reduced pressure and the product was isolated by silica gel column chromatography with hexane/ethyl acetate.

Yield: 6.8g = 83%.

#### EXAMPLE 1

10 2-(stearoyloxymethyl)-2-(N-(fluorenyl)methoxycarbonyl)-L-valyloxymethyl)-  
propionic acid

To a solution of 2,2-bis(hydroxymethyl) propionic acid (28.16 g, 210 mmole ) in water (50 ml), was added potassium hydroxide (11.78 g, 210 mmole). After 5 min,  
15 the solution was evaporated in vacuo and the residue was coevaporated with dry DMF for three times. The residue was then dissolved in DMF (500 ml), and to the solution was added benzyl bromide (3.57 ml, 30 ml). After stirring for 30 min, the reaction mixture was filtered through the Celite, poured into sodium hydrogen carbonate aqueous solution and extracted with dichloromethane. The organic phase  
20 was collected and then washed with sodium hydrogen carbonated aqueous solution. It was then evaporated in vacuo to give benzyl 2,2-bis(hydroxymethyl) propionate (4.37 g).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 7.35 (s, 5H), 5.20 (d, 2H), 3.91-3.71 (m, 4H), 1.10 (s, 3H).

25

To a solution of benzyl 2,2-bis(hydroxymethyl) propionate (4.37 g, 19.5 mmole) in pyridine (58 ml) was added dropwise stearoyl chloride (4.13 g, 13.6 mmole) in dichloromethane over 40 min. The reaction was then kept for 16 hr and then poured into sodium hydrogen carbonate aqueous solution and extracted with  
30 dichloromethane. The organic phase was collected and evaporated in vacuo. The product benzyl-2-(hydroxymethyl)-2- (stearoyloxymethyl) propionate was isolated by silica gel column chromatography (1.97 g)

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 7.34 (s, 5H), 5.17 (d, 2H), 4.28 (dd, 2H), 3.69 (dd, 2H), 2.24 (t, 2H), 1.57 (m, 2H), 1.25 (s, 28H), 1.22 (s, 3H), 0.87 (t, 3H).

Benzyl-2-(hydroxymethyl)-2-(stearoyloxymethyl) propionate (1.86 g, 3.8 mmole) was dissolved in pyridine (30 ml). To the solution were added toluenesulfonic acid (73 mg, 0.39 mmole), N-fluorenylmethoxycarbonyl-L-valine (3.94 g, 11.6 mmole), and DCC (3.58 g, 17.4 mmole). The reaction was kept at 4 °C for 16 hr and then filtered through Celite. The filtrate was poured into sodium hydrogen carbonate aqueous solution and extracted with dichloromethane. The organic phase was collected and evaporated in vacuo. The product, benzyl-2-(N-fluorenylmethoxycarbonyl)-L-valyloxymethyl)-2-(stearoyloxymethyl)propionate, was isolated by silica gel column chromatography. Yield: 2.38 g.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 7.78-7.25 (m, 13H), 5.29 (m, 1H), 5.15 (d, 2H), 4.38 - 4.23 (m, 7H), 2.19 (t, 2H), 2.10 (m, 1H), 1.55 (m, 2H), 1.24 (m, 31H), 0.94 - 0.83 (m, 9H).

To the solution of benzyl 2-(N-(fluorenylmethoxycarbonyl)-L-valyloxymethyl)-2-(stearoyloxymethyl) propionate (1.86 g, 3.8 mmole) in a mixed solvent of THF/methanol (16ml/8ml) were added ammonium formate (376 mg, 6 mmole), formic acid (1.87 ml), and palladium black (40 mg). The reaction was kept at room temperature for 16 hr, and then filtered through Celite. After evaporation, the product was isolated by silica gel column chromatography. Yield: 1.05 g.

### 1-O-stearoyl-2-O-(N-CBz-L-valyl)glycerol

#### a) Preparation of 1-O-stearoylglycerol

To a mixture of glycerol (30 g, 326 mmol) and pyridine (25 ml) dissolved in DMF (300 ml) was added dropwise stearoyl chloride (10 g, 33 mmol) dissolved in DMF 100 ml. The mixture was cooled on an ice bath until addition was complete, whereupon the reaction was maintained under an N<sub>2</sub> atmosphere overnight. After 15 hours CH<sub>2</sub>Cl<sub>2</sub> (300 ml) and saturated NaHCO<sub>3</sub> (aq) was added. The phases were separated and the organic phase washed with water (50 ml) and dried with Na<sub>2</sub> SO<sub>4</sub>.

The solvent and any pyridine were evaporated under vacuum. The crude product was chromatographed on a silica column ( $\text{CH}_2\text{Cl}_2$  - MeOH, 20:1) and recrystallised ( $\text{CH}_2\text{Cl}_2$  - ether) to yield around 7 grams.

5 b) Preparation of pixyl chloride

Acetyl chloride (150 ml, 2.1 mol) is added to a magnetically stirred suspension of 9-hydroxy-9-phenylxanthene (20 g 72 mmol) in benzene (100 ml). An homogenous deep red solution is obtained. The solution is stirred for 30 min. at 20 °C. The volatiles are removed under reduced pressure. Excess AcCl is neutralised by careful addition to ethanol. The residue is coevaporated with toluene (2 x 30 ml) and with cyclohexane (2 x 30 ml) to obtain a crystalline residue which is stored airtight. Pixyl chloride is alternatively available from Aldrich.

c) Preparation of 1-O-stearoyl, 3-O-pixylglycerol

15 The product from a) above (2.28 g) and pyridine (25 ml) were mixed and heated until dissolved. After cooling in an icebath pixyl chloride (1.92 g) from step b) was added. The mixture was maintained under agitation and an argon atmosphere in an icebath for half an hour and then at room temperature for 1.5 h. The pyridine was evaporated under vacuum, the residue dissolved in  $\text{CH}_2\text{Cl}_2$  (70 ml) and washed with 0.5 M  
20 citric acid to remove remaining pyridine. The residue was dried with  $\text{Na}_2\text{SO}_4$ , evaporated and chromatographed (ether- hexane 1:3) to give 1.25 g pure product with a TLC  $R_f$  around 0.2.

d) Preparation of 1-O-stearoyl, 2-O-(N-CBz-L-valyl), 3-O-pixylglycerol

25 The product of step c) (237 mg, 0.39 mmol), CBz-L-valine (116 mg, 0.46 mmol), DCC (96 mg, 0.46 mmol) and DMAP (4.7 mg, 0.04 mmol) were dissolved in  $\text{CH}_2\text{Cl}_2$  (4 ml). The mixture was maintained under agitation in a nitrogen atmosphere overnight. After 18 hours the mixture was filtered through a glass filter and chromatographed on a silica gel column (ether - hexane 1:4) to yield 230 mg with a  
30 TLC  $R_f$  of 0.2

e) Preparation of 1-O-stearoyl-2-O-(N-CBz-L-valyl)glycerol

The pixyl group in the product of step d) was removed by selective deprotection by the method described in Example 3, step d to yield the title compound.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.35 (m, 5H), 5.3-4.9 (m, 4H), 4.35-4.25 (m, 3H), 3.8-3.6 (m, 2H), 2.31-2.25 (m, 2H), 2.20-2.10 (m, 1H), 1.60 (m, 2H), 1.02-0.86 (m, 9H).

### EXAMPLE 3

#### 1-O-(N-CBz-L-valyl)-2-O-stearoylglycerol

##### 10 a) Preparation of 1-O-(N-CBz-L-valyl)glycerol

CBz-L-valine (4.35 g, 17.3 mmol) was added to a fivefold excess of glycerol (8 ml, 86.9 mmol) together with dicyclohexylcarbodiimide (4.29 g 20.8 mmol) and 4-dimethylaminopyridine (0.212 g) at room temperature. After stirring overnight the suspension was filtered and DMF removed in vacuo from the filtrate. The residue  
15 was redissolved in CH<sub>2</sub>Cl<sub>2</sub>, washed successively with saturated NaHCO<sub>3</sub>, brine, and water and then dried. The crude material was chromatographed on silica gel with 4/1 EtOAc - hexane as eluent to yield 2.465 g. R<sub>f</sub> (4/1 EtOAc - hexane) 0.17, (20/1 CH<sub>2</sub>Cl<sub>2</sub> - methanol) 0.12.

##### 20 b) Preparation of 1-O-(N-CBz-L-valyl)-3-O-pixylglycerol

The product of step a) (0.672 g, 20.1 mmol) was dissolved in dry pyridine (3.5 ml) under nitrogen. 9-Chloro-9-phenylxanthene (pixyl chloride, 0.65 g, 22.0 mmol, 1.1 eq - prepared as above) was added and the mixture stirred at room temperature for 1.5 h. MeOH (1.5 ml) was added and the mixture partitioned between 10 ml Et<sub>2</sub>O and  
25 10 ml saturated NaHCO<sub>3</sub>. The aqueous layer was extracted with more ether. The organic layers were combined, dried and concentrated several times with toluene to give a white solid. The crude material was chromatographed on silica gel with 3/1 hexane - EtOAc as eluent to give 0.681 g.

30 Alternatively a pixyl group can be put on by the procedure described by Gaffney et al, Tetrahedron Lett 1997, 38, 2539-2542 using PxOH and acetic acid.

## c) Preparation of 1-O-(N-CBz-L-valyl)-2-O-stearoyl-3-O-pixyl glycerol

Stearoyl chloride (496 ml, 1.3 eq) in 1.5 ml  $\text{CH}_2\text{Cl}_2$  was added dropwise to a solution of the product of step b) (0.658 g, 1.13 mmol) in 11 ml pyridine with stirring under  $\text{N}_2$  in an ice bath. After 15 minutes the mixture was stirred at room temperature overnight. The mixture was diluted with 20 ml  $\text{Et}_2\text{O}$  and washed with 10 ml saturated  $\text{NaHCO}_3$ . The aqueous layer was extracted with more  $\text{Et}_2\text{O}$ . The organic layers were combined, washed with brine (20 ml), dried over  $\text{Na}_2\text{SO}_4$  and concentrated several times with toluene. The crude material (1.37 g) was chromatographed on 130 g silica gel with 6/1 hexane -  $\text{EtOAc}$ . An initial fraction of 500 ml was taken followed by 10 100 ml fractions. The desired material eluted in fractions 2 - 5 yielding 0.748 g.

## d) Preparation of 1-O-(N-CBz-L-valyl)-2-O-stearoylglycerol

To a solution of the product of step c) (0.748 g, .872 mmol) dissolved in 35 ml  $\text{CH}_2\text{Cl}_2$  to make 0.025 M) was added pyrrole (16.5 mol eq) and dichloroacetic acid 15 (5.5 mol eq) at room temperature. TLC after 5 minutes showed complete reaction. The mixture was diluted with 300 ml  $\text{CH}_2\text{Cl}_2$  and washed with 30 ml saturated  $\text{NaHCO}_3$ . The aqueous layer was extracted with more  $\text{CH}_2\text{Cl}_2$ . The organic phases were combined, washed with brine (30 ml), dried over  $\text{Na}_2\text{SO}_4$  and concentrated. Crude material was chromatographed on silica gel with 2/1 hexane -  $\text{EtOAc}$  (with 20 0.3% acetic acid) as eluent to yield 0.363 g with  $R_f$  (2/1 hexane -  $\text{EtOAc}$ ) 0.21.

$^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  ppm 0.86-0.99 (m, 9H), 1.25 (s, 28H), 1.61 (m, 2H), 2.16 (m, 1H), 2.32 (m, 2H), 3.74 (br s, 2H), 4.28-4.44 (m, 3H), 5.09 (m, 1H), 5.11 (s, 2H), 5.22 (d, 1H), 7.36 (m, 5H)

## EXAMPLE 4

1-O-stearoyl-3-O-(NCBz-L-valyl)glycerol

The product of Example 2, part a) (2.86 g, 7.99 mmol), DCC (0.9g, 4.36 mmol) 4- 30 (N,N-dimethyl)aminopyridine (DMAP) (0.048 mg, 0.39 mmol) and N-CBz-L-valine (1g, 3.98 mmol) were dissolved in  $\text{CH}_2\text{Cl}_2$  (60 ml) and DMF (6 ml). The reaction was left at ambient temperature for 18 hours and then filtrated. The solvent was evaporated under reduced pressure. The residue was dissolved in  $\text{CH}_2\text{Cl}_2$  (100 ml)

and filtrated. The crude title compound was purified by chromatography [SiO<sub>2</sub>, ether/hexane (1:2)] to yield 1.3 g of the desired product. Unreacted 1-stearoylglycerol may be recovered by eluting with CH<sub>2</sub>Cl<sub>2</sub>/MeOH (20:1).

5 <sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 5.25 (d, 1H), 5.11 (s, 2H), 4.30-4.05 (m, 6H), 2.65 (d, 1H), 2.35 (t, 2H), 2.06 (m, 1H), 1.62 (m, 2H), 1.26 (s, 28H), 1.00-0.84 (m, 9H).

#### EXAMPLE 5

10

To an ice cooled solution of 1-chloroethyl chloroformate (1.89 g, 13.2 mmol) in dry CH<sub>2</sub>Cl<sub>2</sub> (5 ml), was added the compound of Example 4 in CH<sub>2</sub>Cl<sub>2</sub> (20 ml) followed by dry pyridine (1.2 ml, 29.6 mmol). The reaction mixture was stirred with cooling under argon atmosphere until TLC (ether/hexane, 1:2) indicated consumption of the starting material. After 1.5 h, the mixture was washed with water (3 x 5 ml), sat. NaHCO<sub>3</sub> (5 ml) and dried (Na<sub>2</sub>SO<sub>4</sub>). Purification by chromatography [SiO<sub>2</sub> (ether-hexane (1:2))] yielded the title compound (4.0 g).

15 <sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.36-7.32 (m, 5H), 6.40 (m, 1H), 5.24 (m, 1H), 5.11 (s, 2H), 4.30 (m, 6H), 2.32 (m, 2H), 2.15 (m, 1H), 1.82 (m, 3H), 1.60 (m, 2H), 1.25 (br s, 28H), 0.97 (m, 3H), 0.86 (m, 6H).

#### EXAMPLE 6

25

To a solution of the compound of Example 5 (3.4 g, 4.87 mmol) in dry acetonitrile (47 ml), was added sodium iodide (3.65 g, 24.3 mmol). The solution obtained was refluxed under argon atmosphere until NMR indicated consumption of the starting

material. After 4.5 h, ether (50 ml) was added and the mixture was filtrated. The solvent was removed by evaporation and the crude product dissolved in ether (50 ml). The ether solution was washed with water (2 x 10 ml) and dried ( $\text{Na}_2\text{SO}_4$ ) and evaporated under reduced pressure. Purification by chromatography [ $\text{SiO}_2$ , ether-hexane (1:2)] yielded the title compound (2.15 g).

$^1\text{H}$ -NMR ( $\text{CDCl}_3$ ):  $\delta$  7.37 (m, 5H), 6.75 (m, 1H), 5.22 (m, 1H), 5.15 (s, 1H), 4.3 (m, 6H), 2.32 (m, 1H), 2.22 (m, 2H), 1.6 (m, 2H), 1.25 (s, 28H), 0.95 (m, 9H).

#### 10 EXAMPLE 7

A solution of the compound of Example 3 (810 mg, 1.37 mmol) in 2.2 mL dry dichloromethane was cooled in an ice bath with stirring under argon. 1-Chloroethyl chloroformate (298  $\mu\text{L}$ , 2.74 mmol) was added, followed by the dropwise addition of pyridine (665  $\mu\text{L}$ , 8.22 mmol) in 2.5 mL dichloromethane. After 2.5 hr, the mixture was diluted with 25 mL dichloromethane and washed successively with 10 mL water and 10 mL brine. The organic phase was dried over anhydrous sodium sulfate and concentrated several times with toluene to give a yellow oil. Purification by flash column chromatography on silica gel with 40/1 dichloromethane-diethyl ether gave the title compound as an oil (96 mg, quantitative yield).

$^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  ppm 0.85-0.98 (m, 9H), 1.25 (s, 28H), 1.60 (m, 2H), 1.83 (d, 3H,  $J = 5.8$  Hz), 2.17 (m, 1H), 2.31 (t, 2H), 4.19-4.48 (m, 5H), 5.11 (s, 2H), 5.22 (d, 1H), 5.27 (m, 1H), 6.38-6.43 (m, 1H), 7.36 (m, 5H).

#### EXAMPLE 8

A solution of the compound of Example 7 (1.896 g, 2.71 mmol) and sodium iodide (1.80 g, 12.0 mmol) in acetonitrile (27 mL) was refluxed at 80 °C under nitrogen.

- 5 After 4.5 hours the reaction mixture was diluted with 100 mL 1/1 hexane-diethyl ether and washed with 25 mL water. The aqueous phase was extracted with more solvent (25 mL). The organic phases were combined, washed successively with 5% aqueous sodium thiosulfate solution (25 mL) and brine (25 mL), dried over anhydrous sodium sulfate, and concentrated *in vacuo*. Purification by flash column chromatography on silica gel with 80/1 dichloromethane-methanol as eluant gave an oil (1.45 g) containing 90% of the title compound with 10% of the compound of Example 7.

##### b) Preparation of 1-O-(N-trityl-L-valyl)-2-allyl-1,3-propandiol

To a solution of N-trityl-L-valine (5.5 g, 15.2 mmole), 2-allyl-1,3-propandiol (4.4 g, 38 mmol), N,N-dimethylamino pyridine (183 mg, 1.5 mmol) in dichloromethane (120 ml) was added DCC (3.5 g, 16.7 mmol). The reaction was kept under reflux overnight. After filtration through Celite, the organic phase was washed with sodium hydrogen carbonate aqueous solution and dried. Silica gel column chromatography gave 4.6 g intermediate 1-O-(N-trityl-L-valyl)-2-allyl-1,3-propandiol.

##### c) Preparation of 1-O-(N-trityl-L-valyl)-2-allyl-3-stearoyl-1,3-propandiol.

To a solution of 1-O-(N-trityl-L-valyl)-2-allyl-1,3-propandiol (1.83 g, 4 mmol) in dichloromethane (40 ml) and pyridine (3.2 ml, 40 mmol) at 0 °C was added dropwise stearoyl chloride (3.62 g, 12 mmol) in dichloromethane. The solution was warmed up to room temperature, and kept for 3 hr. It was then washed with sodium hydrogen carbonate aqueous solution and dried. The product was isolated by silica gel column chromatography. 1.9 g

b) Preparation of 1-O-(N-benzyloxycarbonyl-L-valyl)-2-allylyl-3-O-stearoyl-1,3-propandiol.

To a solution of 1-O-(N-benzyloxycarbonyl-L-valyl)-2-allyl-1,3-propandiol (4.46 g, 12.7 mmol) in dichloromethane (70 ml) and pyridine (6.1 ml, 76 mmole) in ice bath was added stearoyl chloride (7.8 g, 26 mmole). The reaction mixture was warmed up to room temperature and kept for one hour. It was then poured into aqueous sodium hydrogen carbonate solution, the organic phase was dried and the product 1-O-(N-benzyloxycarbonyl-L-valyl)-2-allyl-3-O-stearoyl-1,3-propandiol was purified by silica gel column chromatography. 6.7 g

c) Preparation of 3-(N-benzyloxycarbonyl-L-valyloxymethyl)-4-stearoyloxy-butyric acid.

Potassium permanganate (756 mg, 4.8 mmole) was dissolved in water (7.5 ml). The solution was kept under strong stirring for 10 min. A solution of 1-O-(N-benzyloxycarbonyl-L-valyl)-2-allyl-3-O-stearoyl-1,3-propandiol (1 g, 1.6 mmol) and tetrabutylammonium bromide (77 mg, 0.24 mmole) in benzene (5 ml) was added. The slurry was stirred for 1.5 hr, and dichloromethane was added. A sodium bisulfite aqueous solution was added to the slurry until the mixture discolored. The organic phase was acidified with acetic acid and washed with water. After evaporation, the product 3-(N-benzyloxycarbonyl-L-valyloxymethyl)-4-stearoyloxy-butyric acid (390 mg) was isolated by silica gel column chromatography.

The mixture was evaporated under reduced pressure, acidified with 2N HCl and extracted two times with ethyl acetate. The combined organic phase was washed three times with water, dried with sodium sulfate and evaporated under reduced pressure.

The product was isolated by silica gel column chromatography. Yield: 7.8g

b) Synthesis of 2', 3'-dideoxy-3'-fluoro-5'-O-[3-(1,3-dibenzyloxy-2-propyloxycarbonyl)-propanoyl] guanosine.

5 A mixture of 2', 3'-dideoxy-3'-fluoroguanosine (1.61g, 6 mmole), HOBT (0.972g, 7.2 mmole), DMAP (73.3mg, 0.6 mmole) and 1,3-dibenzyloxy-2-propyl succinate monoester (2.68g, 7.2 mmole) was coevaporated two times with DMF and reduced to about 150ml. DCC (1.55g, 7.5 mmole) was added and the mixture was stirred 72 hours at room temperature. The mixture was filtered and the solution was evaporated under reduced pressure. Ethyl acetate (200 ml) was added and the organic phase washed twice with 5% acetic acid, 5% sodium hydrogen carbonate and water. The organic phase was dried with sodium sulfate and evaporated under reduced pressure. The product was isolated by silica gel column chromatography. Yield: 3.3g

15 c) Synthesis of 2', 3'-dideoxy-3'-fluoro-5'-O [3-(1,3-dihydroxy-2-propyloxy carbonyl)propanoyl]guanosine.

A solution of 2', 3'-dideoxy-3'-fluoro-5'-O-[3-(1,3-dibenzyloxy-2-propyloxy carbonyl)propanoyl]guanosine (3.2g, 5.13 mmole) in 50ml ethyl acetate, 50ml methanol and 10ml acetic acid was hydrogenated with palladium black (0.6g) under 20 40 psi overnight. The catalyst was filtered and washed with methanol, The solution was evaporated under reduced pressure and the product was isolated by silica gel column chromatography. Yield: 1.64g

d) Synthesis of 2',3'-dideoxy-3'-fluoro-5'-O- {3-[1,3-Bis ( N-CBZ-L-valyloxy)-2-propyloxycarbonyl]propanoyl} guanosine.

25 A mixture of 2',3'-dideoxy-3'-fluoro-5'-O-[3-(1,3-dihydroxy-2-propyloxy carbonyl)-propanoyl]guanosine (1.93g, 2.93 mmole), N-CBZ-L-valine (1.76g, 7 mmole), HOBT (0.95g, 7 mmole) and DMAP (85.5mg, 0.7 mmole) was coevaporated two times with DMF and reduced to about 60ml. DCC (1.55g, 7.5 mmole) was added and the mixture was stirred overnight at room temperature. The mixture was warmed for 30 four hours at 60°C and then cooled to about 10°C. The mixture was filtered and the solution was reduced under reduced pressure. Ethyl acetate (150 ml) was added and the organic phase was washed twice with 5% acetic acid, 5% sodium hydrogen

carbonate and water. The organic phase was dried with sodium sulfate and evaporated under reduced pressure. The product was isolated by silica gel column chromatography. Yield: 1.6g.

- 5 e) Synthesis of 2', 3'-dideoxy-3'-fluoro-5'-O-{3-[1,3-bis-(L-valyloxy)-2-propyloxycarbonyl]-propanoyl} guanosine.

A solution of 2', 3'-dideoxy-3'-fluoro-5'-O-{3-[1,3-bis-(N-CBZ-L-valyloxy)-2-propyloxycarbonyl]propanoyl} guanosine (1.6g, 1.75 mmole) in 80ml ethyl acetate, 20ml methanol and 20 ml acetic acid was hydrogenated with palladium black (0.3g) for two hours at room temperature and normal pressure. The catalyst was filtered and washed with methanol. The solution was evaporated under reduced pressure and the product was isolated as the diacetate salt by silica gel column chromatography. a) Synthesis of succinic acid 1,3-dibromo-2-propyl ester, 1,1-dimethylethyl ester.

15 To a solution of 1,3-dibromopropan-2-ol (10.9 g 50 mmole), succinic acid 1,1-dimethylethyl ester (J. Org.Chem 59 (1994) 4864) (10.45g, 60 mmole) and DMAP (0.61 g, 5 mmole) in dichloromethane (180ml) was added DCC (12.4 g, 60 mmole) in portions at about 10°C. The mixture was stirred overnight at room temperature and cooled to about 5°C. The mixture was filtered and the solution was evaporated under  
20 reduced pressure. 250ml ethyl acetate was added and the organic phase was washed twice with 5% citric acid, 5% sodium hydrogen carbonate and water. The solution was dried with sodium sulfate and evaporated under reduced pressure. The product was distilled in vacuo. (bp 0,5 135-140°C ) Yield: 16.8 g

b) Synthesis of succinic acid 1,3-bis-(N-CBZ-L-valyloxy)-2-propyl ester, 1,1-dimethylethyl ester.

To a solution of N-CBZ-L-valine (18.85 g, 75 mmole) in dried DMF (100ml) was  
30 added potassium tert.-butoxide (7.85 g, 70 mmole) and the mixture was stirred for one hour at room temperature. A solution of succinic acid 1,3-dibromo-2-propyl ester, 1,1-dimethylethyl ester (9.35g, 25 mmole) in dried DMF (20ml) was added and the mixture was stirred for eighteen hours at 60°C. The potassium bromide was

filtered and the solution evaporated under reduced pressure. 300ml of ethyl acetate were added and the organic phase washed twice with 5% sodium hydrogen carbonate and with water. The organic phase was dried with sodium sulfate and evaporated under reduced pressure. The product was isolated by silica gel column

a) Preparation of (1-(N-benzyloxycarbonyl)-L-valyloxy)-3-stearoyloxypropyl-2-oxycarbonyl propionic acid

To a solution of (1-(N-benzyloxycarbonyl)-L-valyloxy)-3-stearoyloxypropan-2-ol (8.1 g, 13.7 mmole) in N,N-dimethylformamide (135 ml) and pyridine (10 ml) was  
30 added succinic anhydride (4.1 g, 41.1 mmole) and the solution was stirred for 72 hr at 60 °C. The reaction was cooled to room temperature and acetic anhydride (13 ml) was added and the solution was stirred over night. The reaction was quenched by addition of aqueous sodium hydrogen carbonate solution (3 ml). After concentration

on rotavapor, the residual concentrated solution was poured into aqueous sodium hydrogen carbonate solution and extracted with dichloromethane. The organic phase was evaporated and the residue silica gel column chromatographed (20, 30, 50, 80% ethyl acetate in hexane). The appropriate fractions were pooled and evaporated in vacuo to give the title compound (6.8 g).  $R_f$  (5%MeOH/CHCl<sub>3</sub>) 0.65.

b) Preparation of 4-methoxybenzyl 3-[3-{1-(N-benzyloxycarbonyl)-L-valyloxy-3-stearoyloxypropyl-2-oxycarbonyl} propionyloxy]-2,2-dimethylpropionate

(1-(N-benzyloxycarbonyl)-L-valyloxy)-3-stearoyloxypropyl-2-oxycarbonyl propionic acid  
(5.8 g, 8.38 mmol), 4-methoxybenzyl 2-(hydroxymethyl)-2-methyl propionate (2.09 g, 8.80 mmole), 4-dimethylaminopyridine (153 mg) and 1-hydroxybenzotriazole (1.13g, 8.38 mmole) were mixed and dissolved in N,N-dimethylformamide (70 ml). Then dicyclohexyl-carbodiimide (2.07 g 10.06 mmol) was added. After stirring for 4 days at room temperature the suspension was filtered and the filtrate evaporated in vacuo. The residue was partitioned between 0.1M citric acid and dichloromethane. The organic phase was then extracted with aqueous saturated NaHCO<sub>3</sub> and evaporated in vacuo. The residue was silica gel column chromatographed (20, 30, 60, 100% ethyl acetate in hexane). The appropriate fractions were pooled and evaporated in vacuo to give the title compound (5.73g).

Iodomethyl 5-(N-CBz-L-valyloxy)-4-stearoyloxy-2,2-dimethylvalerate

## a) 4-Methoxybenzyl 2,2-dimethyl-4-pentenoate

To a solution of 2,2-dimethyl-4-pentenoic acid (11.5 g, 90 mmol) in DMF (250 mL) at room temperature, was added potassium tert-butoxide (11.1 g, 99 mmol). The reaction mixture was stirred at 60 °C for 1 h. 4-Methoxybenzylchloride (16.9 g, 108 mmol) was added and the reaction mixture was stirred at 60 °C for 4 h. The DMF was evaporated under vacuum, the residue was dissolved in ether (500 mL) and washed with water (3 x 200 mL). The organic phase was dried with Na<sub>2</sub>SO<sub>4</sub> and evaporated to give 21.4 g of 4-methoxybenzyl 2,2-dimethyl-4-pentenoate.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 7.27 (d, *J* = 8.7 Hz, 2H), 6.88 (d, *J* = 8.7 Hz, 2H), 5.8-5.6 (m, 1H), 5.1-4.9 (m, 2H), 5.03 (s, 2H), 3.80 (s, 3H), 2.27 (d, 2H), 1.17 (s, 6H).

## b) 4-Methoxybenzyl 4,5-dihydroxy-2,2-dimethylvalerate

To a mixture of 4-methoxybenzyl 2,2-dimethyl-4-pentenoate (22.5 g, 91 mmol), NMO (36.7 g, 272 mmol) and tert-butanol (100 mL) in THF (400 mL) at 0 °C, was added osmium tetroxide (230 mg, 0.9 mmol). After 1 h at 0 °C, the temperature of the reaction mixture was allowed to assume room temperature and then the mixture was stirred for 4 h at room temperature. After evaporation, water (300 mL) was added and the resulting mixture was extracted with CH<sub>2</sub>Cl<sub>2</sub> (5 x 300 mL). The combined organic layers were dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated under reduced pressure. The crude product was column chromatographed (silica gel, 3→10% MeOH in CH<sub>2</sub>Cl<sub>2</sub>), to give 20.4 g of 4-methoxybenzyl 4,5-dihydroxy-2,2-dimethylvalerate.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): 7.27 (d, *J* = 8.7 Hz, 2H), 6.87 (d, *J* = 8.7 Hz, 2H), 5.03 (s, 2H), 3.8-3.7 (m, 1H), 3.79 (s, 3H), 3.51 (dd, 1H), 3.36 (dd, 1H), 3.04 (br s, 1H), 2.74 (br s, 1H), 1.87 (dd, 1H), 1.46 (dd, 1H), 1.24 (s, 6H).

## f) Chloromethyl 5-(N-CBz-L-valyloxy)-4-stearoyloxy-2,2-dimethylvalerate.

To a solution of 5-(N-CBz-L-valyloxy)-4-stearoyloxy-2,2-dimethylvaleric acid (16.0 g, 24 mmol) in dioxane (500 mL), was added dropwise a 40% aqueous solution of tetrabutylammonium hydroxide (14.3 mL). After stirring for 5 min, the solution was evaporated to dryness through co-evaporation with dioxane and toluene. The residue was dissolved in dichloromethane (500 mL) and then chloriodomethane (17.5 mL, 240 mmol) was added and the solution was stirred for 6 h at room temperature. The solution was concentrated under reduced pressure and the residue was shaken with hexane / ethyl acetate (1:1 v/v, 400 mL). The yellow crystalline solid was filtered off and the filtrate was washed with aqueous solution of sodium thiosulfate (0.1 M) and the filtered through anhydrous sodium sulfate and evaporated to dryness. The residue was column chromatographed (silica gel, 1% MeOH in  $\text{CH}_2\text{Cl}_2$ ), to give 11.0 g of chloromethyl 5-(N-CBz-L-valyloxy)-4-stearoyloxy-2,2-dimethylvalerate.

## g) Iodomethyl 5-(N-CBz-L-valyloxy)-4-stearoyloxy-2,2-dimethylvalerate.

To a solution of chloromethyl 5-(N-CBz-L-valyloxy)-4-stearoyloxy-2,2-dimethylvalerate (7.8 g, 11 mmol) in acetonitrile (100 mL), was added sodium iodide (6.5 g, 44 mmol). The solution was stirred for 4 h at 60 °C. The resulting suspension was filtered and the filtrate was evaporated. The residue was dissolved in CH<sub>2</sub>Cl<sub>2</sub> and washed with aqueous sodium thiosulfate (0.1 M). The organic phase was dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated under reduced pressure. The crude product was column chromatographed (silica gel, 1% MeOH in CH<sub>2</sub>Cl<sub>2</sub>), to give 7.84 g of iodomethyl 5-(N-CBz-L-valyloxy)-4-stearoyloxy-2,2-dimethylvalerate

#### EXAMPLE A-1

4-amino-1-hydroxybutylidene-1,1-bisphosphonic acid, tri(2-methyl-2-(L-valyloxymethyl) propionyloxymethyl) ester.

a) 4-Benzyloxycarbonylamino-1-hydroxybutylidene-1,1-bisphosphonic acid, tri(2-methyl-2-(N-benzyloxycarbonyl-L-valyloxymethyl) propionyloxymethyl) ester and 4-benzyloxycarbonylamino-1-hydroxybutylidene-1,1-bisphosphonic acid, di(2-methyl-2-(N-benzyloxycarbonyl-L-valyloxymethyl) propionyloxymethyl) ester.

4-Benzyloxycarbonylamino-1-hydroxybutylidene-1,1-bisphosphonic acid is prepared by the methodology in Kieczykowski et al, J Org Chem 1995, 60, 8310-8312, and the 4-amino group CBz protected as shown in US 5 227 506. To a solution thereof (195 mg, 0.51 mmole) in dry N,N-dimethylformamide (2 ml), was added diisopropylethylamine (0.27 ml, 1.53 mmole), followed by an injection of a solution of iodomethyl 2-methyl-2-(N-benzyloxycarbonyl-L-valyloxymethyl) propionate (626 mg, 1.27 mmole) in N,N-dimethylformamide (2 ml). After stirring under argon for 2,5 h at room temperature, the solution was concentrated on rotavapor and treated with ethyl acetate (10 ml). Crystals were filtered off and the filtrate was extracted with brine containing a small amount of sodium thiosulfate. The organic phase was filtered

through anhydrous sodium sulfate and evaporated. The title compounds were isolated by silica gel column chromatography (0-4, 7-8, 20-30% ethanol in dichloromethane).

4-Amino-1-hydroxybutylidene-1,1-bisphosphonic acid di-((2-(L-valyloxy)-ethoxycarbonyloxy) methyl) ester

a) 4-benzyloxy carbonylamino-1-hydroxybutylidene-1,1-bisphosphonic acid di-((2-(N-CBz-L-valyloxy)-ethoxycarbonyloxy) methyl) ester

10 To a solution of 4-benzyloxy carbonylamino-1-hydroxybutylidene-1,1-bisphosphonic acid (550 mg, 1.44 mmol) in DMF (10 mL), was added diisopropylamine (0.75 mL, 4.32 mmol), followed by an injection of a solution of 2-(N-CBz-L-valyloxy)-ethyl iodomethyl carbonate (1.40 g, 3.60 mmol) in DMF (5 mL). After stirring under argon for 1.5 h at room temperature, the solution was concentrated on rotavapor and  
15 treated with ethyl acetate (100 mL). Crystals were filtered off and the filtrate was extracted with brine containing a small amount of sodium thiosulfate. The organic phase was filtered through anhydrous sodium sulfate and evaporated. After silica gel column (silica gel, 4 $\rightarrow$ 20% MeOH in  $\text{CH}_2\text{Cl}_2$ ), the pure fractions containing the title compound were combined and evaporated. The residue was then dissolved in ethyl  
20 acetate and the solution extracted twice with aqueous saturated sodium bicarbonate and then twice with 5% aqueous EDTA-disodium salt. The ethyl acetate phase was evaporated, to give 160 mg of 4-benzyloxy carbonylamino-1-hydroxybutylidene-1,1-bisphosphonic acid di-((2-(N-CBz-L-valyloxy)-ethoxycarbonyloxy) methyl) ester.

Drying over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentration gave a yellow oil that was subjected to column chromatography (silica, 2/1 petroleum ether – ethyl acetate, 2.5 – 20% methanol in CH<sub>2</sub>Cl<sub>2</sub>) to give fine, white solids (147 mg) enriched in the triester. The solids were dissolved in ethyl acetate, washed twice with 5% aqueous EDTA-disodium salt, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, and evaporated to dryness under vacuum.

(b) Removal of benzyloxycarbonyl protecting groups

The triester (110 mg) from step (a) was hydrogenated at 40 psi over Pd black (14 mg) in 4.2 mL solvent (2/1/1 ethyl acetate - methanol - acetic acid) for 18.5 h. The suspension was filtered through a small column of celite and washed with ethyl acetate - methanol. The filtrate was evaporated to dryness under vacuum to give white solids (97 mg). Because proton NMR showed incomplete deprotection, the material was resubmitted for hydrogenation (14 mg Pd, 10 mL solvent) overnight to give the deprotected triester (as the acetate salt, 79 mg) as shown by the disappearance of peaks for the benzyloxy group at  $\delta$  5.05 and 7.30.

c) Chloromethyl 4-(4-methoxybenzyloxy)benzoate

To a solution of 4-(4-methoxybenzyloxy) benzoic acid (5.16 g, 20 mmole) in 100 ml 1,4-dioxane was added a 40% solution of tetrabutylammonium hydroxide (14.27 g, 22 mmole) and the mixture was stirred 2 hours at room temperature. The mixture was evaporated under reduced pressure and co-evaporated two times with 1,4-dioxane and two times with toluene. The dried product was dissolved in 60 ml dichloromethane and iodochloromethane (35.3 g 200 mmole) was added. The solution was stirred for two days at room temperature and evaporated under reduced pressure. About 100 ml ethyl acetate was added and the organic phase washed twice with water, dried with sodium sulfate and evaporated under reduced pressure. The product was isolated by silica gel column chromatography. Yield: 4.48 g = 73%

d) Iodomethyl 4-(4-methoxybenzyloxy) benzoate

To a solution of chloromethyl 4-(4-methoxybenzyloxy) benzoate (0.77g, 2.5 mmole) in 15 ml dry acetone was added sodium iodide (1.87g, 12.5 mmole) and the mixture was stirred overnight at room temperature. The mixture was evaporated under reduced pressure and extracted with ethyl acetate/water. The organic phase was washed with a 5% sodium thiosulfate solution, dried with sodium sulfate and evaporated under reduced pressure. Yield 0.86g = 86%

e) (1S, 2S)-N-[*cis*-2-(6-fluoro-2-O-(4(4-methoxybenzyloxy)-benzoyloxymethyl)-3-propionylphenyl (cyclopropyl)-N'-[2-(5-cyanopyridyl)]urea

To a solution of (1S, 2S)-N-[*cis*-2-(6-fluoro-2-hydroxy-3-propionylphenyl) cyclopropyl]-N'-[2-(5-cyanopyridyl)]urea (368mg, 1 mmole) in 5 ml DMF was added a suspension of 60% sodium hydride in mineral oil (44mg, 1.1 mmole) and the mixture was stirred for one hour at room temperature. A solution of iodomethyl-4-(4-methoxybenzyloxy) benzoate (0.84 g, 2.1 mmole) in 2 ml THF was added and the

mixture was stirred overnight at room temperature. 50 ml ethyl acetate were added and the organic phase was washed four times with water, dried with sodium sulfate and evaporated under reduced pressure. The product was isolated by silica gel column chromatography. Yield: 525 mg = 82%

30 BIOLOGICAL EXAMPLE 1  
Pharmacokinetics

Confirmation that orally administered prodrugs of the invention release FLG in vivo is obtained in a rat model which is recognized as a useful model for assessing pharmacokinetic parameters of nucleoside analogues. The oral compositions are administered in a pharmaceutical vehicle comprising propylene glycol, or in the case of the more soluble compounds such as that of Example 26 or Example 34, in water, to duplicate fasted animals in a dosage corresponding to 0.1 mmol/kg. For comparison, a set of rats is iv dosed with 0.01 mmol/kg of the metabolite 2',3'-dideoxy-3'-fluoroguanosine. Serum levels of the metabolite are then monitored in serum collected at intervals from individual animals from 0.5 to up to 12 hours following administration (5 min to 6 hours for FLG).

The metabolite is analysed with HPLC with UV detection at 254 nm, in a manner analogous to Stähle et al 1995, J Pharm. Biomed. Anal. 13, 369-376. An HPLC system can be based on a 0.05 M ammonium-dihydrogen-phosphate buffer, with 1.2 % 2-propanol solvent, buffered to pH 4.5 or 30 mM sodium dihydrogen phosphate buffer with 2% acetonitrile solvent buffered to pH 7.0. The column may be a 100 x 2.1 mm BAS C18 5  $\mu$ m particle size with a 7  $\mu$ m C18 guard column or Zorbax SB-CN C18 150x4.6mm, 5 $\mu$ m column. Protein binding of the compounds of the invention is negligible as is that of the metabolite and ultrafiltration through Amicon or Microcon 30 filters is useful for serum samples. Advantageously the main peak is subject to further column chromatography to better aid in resolution of FLG over low weight serum components. The iv levels are multiplied by a factor of ten in order to obtain AUC values for comparison with the oral values. Absolute oral bioavailability is determined as the ratio between  $^{0-\infty}AUC_{iv}$  and  $^{0-\infty}AUC_{oral}$ .

The compounds of the invention thus provide significantly enhanced oral  
 5 bioavailability relative to the metabolite metabolite 2',3'-dideoxy-3'-  
 fluoroguanosine. Notably, the compounds are released into the blood in a relatively  
 sustained manner, rather than in an immediate peak. This means that effective  
 amounts of the active metabolite are available in the blood for many hours assisting  
 once daily dosage. Additionally, a sustained release avoids the problems of acute  
 10 toxicity seen in compounds with a more rapid release rate.

Although the rat is well recognized as a good model for predicting human  
 bioavailability of nucleoside analogues, species independent bioavailability of a  
 compound of the invention (Example 34) was confirmed in  $\approx 11.5$  kg male and  
 15 female beagle dogs administered orally with 0.05 mmol/kg (38 mg/kg) compound in  
 water or iv 0.005 mmol/kg (1.35 mg/kg) metabolite in water. Plasma collection and  
 analysis as above.

## BIOLOGICAL EXAMPLE 2

Antiviral activity - Retroviruses

As can be demonstrated by the methodology of Biological Example 1, the compounds of the invention release, *in vivo*, the metabolite 2',3'-dideoxy, 3'-fluoroguanosine. *In vitro* measurement of the antiviral activity of this metabolite will thus reflect the *de facto* activity of the compounds of the invention.

In the XTT dye uptake assay of Koshida et al Antimicrob Agents Chemother. 33 778-780, 1989) utilising MT4 cells, the metabolite measured in Biological Example 1 above showed the following *in vitro* activities against retroviruses:

Table 2

HIV or retroviral strain	IC <sub>50</sub> *
HIV-1 <sub>111B</sub>	1 µg/ml
HIV-1 <sup>2441</sup> AZT <sup>r</sup>	1 µg/ml
HIV-1 <sub>111B</sub> TIBO <sup>r</sup>	1 µg/ml
HIV-1 <sup>29/9</sup>	0.7 µg/ml
HIV-2 <sub>SBL6609</sub>	2 µg/ml
SIV <sub>SM</sub>	1 µg/ml

\*Concentration of metabolite inducing 50% inhibition of viral replication

It will thus be apparent that administration of the compounds of the invention induce powerful antiviral activities against the retroviruses HIV-1, HIV-2 and SIV. It should also be noted from the HIV-1<sup>2441</sup> AZT<sup>r</sup> and HIV-1<sub>111B</sub> TIBO<sup>r</sup> results that the antiviral activity of the compounds of the invention does not show cross resistance against strains of HIV which have become resistant to other HIV agents such as the nucleoside analogue AZT or or the non-nucleoside reverse transcriptase inhibitor TIBO.

## BIOLOGICAL EXAMPLE 3

Antiviral activity - HBV

The activity of antivirals on duck hepatitis B virus (DHBV) in ducks is an  
5 acknowledged animal model for the validation of *in vivo* hepatitis B activity in  
humans. The activity of the *in vivo* metabolite measured in Biological Example 2  
above has been assayed in the DHBV model described by Sherker et al (1986)  
Gastroenterology 91, pp 818-824. The results are depicted in Figures 1 and 2 In  
short, 4 control ducks were treated with phosphate buffered saline (PBS) and 4 ducks  
10 with 5 mg/kg/day of the active metabolite. The ducks were two days old when  
inoculated with DHBV and 18 days old when treatment was commenced. The  
metabolite and PBS (controls) were given intraperitoneally for 10 days as twice  
daily injections, at 8 am and 4 pm. Treatment lasted 33 days and the animals were  
followed 5 weeks after the end of treatment.

15 The efficacy of treatment was followed by dot blot-hybridisation of DHBV DNA in  
serum using a radioactive probe and the amount of DHBV measured as the amount  
of radioactivity hybridised. Figure 1 plots the amount of DHBV DNA in serum at  
different timepoints before, during and after treatment.

20 As can be seen in Figure 1, there is no decrease in the amount of DHBV in serum  
during treatment with PBS (control, solid line). The animals given the metabolite  
measured in Biological Example 2 (broken line) showed a dramatic decrease in the  
amount of DHBV in serum during the first 10 days of treatment, whereupon for the  
25 remainder of treatment the level of DHBV DNA was below the detection limit at  
this dose of 5 mg/kg/day. Repeat experiments at dosages of 30 and 3 mg/kg/day and  
with congenitally infected ducks (not shown) also produced similar results, that is a  
dramatic fall in serum DHBV DNA to under the detection threshold. Even at the very  
low dose of 0.3 mg/kg/day the metabolite caused a considerable inhibition of DHBV  
30 *in vivo*. After the finish of treatment, virus reappeared in the serum, as shown in  
Fig. 1. Reappearance of HBV after short term treatment with conventional antivirals  
has been observed earlier in both humans and animals with chronic hepatitis B  
infection.

As can be seen in Fig 2, the weight of the ducks increased in the same way as in the control (PBS treated) animals. The weight increase from about 270 g to about 800 g which was observed during the treatment period is so large that toxic effects, had they occurred, should be easily visible as a change in growth rate. Similar growth curves were also observed for the ducks receiving the higher dosage rate of 30 mg/kg/day. This metabolite is thus clearly non-toxic. As the compounds of the invention are hydrolysed *in vivo* to give this metabolite, as established in Example 2 above, and a nature identical and therefore easily metabolized fatty acid, it can therefore be inferred that no long term toxicity problem can be expected from administration of the compounds of the invention. The absence of acute (short term) toxicity of the compounds of the invention when administered orally is established in Biological Example 2 above.

##### Bioavailability

The release of a compound of Formula P-2 from orally administered prodrugs of Formulae P3 to P8 were monitored in rats. The compounds of Examples P1 to P6 were made up in a propylene glycol vehicle and orally administered to paired fasted male Sprague Dawley rats at a dose corresponding to 0.027 mmol/kg. At 30, 60, 120, 240 & 360 minutes, 0.2 ml blood were collected, centrifuged and frozen for later analysis. The released drug of Formula P-2, (1S, 2S)-N-[*cis*-2-(6-fluoro-2-hydroxy-3-propionylphenyl) cyclopropyl]-N'-[2-(5-cyanopyridyl)] urea was assayed by HPLC. Aliquots comprising 40-100 µl of each plasma sample are mixed with an equal volume of acetonitrile (10 seconds, Vibrofex). The sample is centrifuged (2 min, 14000 RPM) and 30 µl of the supernatant is injected into an HPLC system, as follows.

30 Pre column: RP-18, 7 µm, 15 x 3.2 mm

Column: YMC basic, 3 $\mu$ m, 150 x 3 mm  
Mobile phase: 60 % acetonitrile in 3 mM ammonium acetate, pH 6.4  
Flow rate: 0.4 ml/min  
Detection: UV, 250 nm

P-1	34 %
P-2	18 %
P-3	27 %
P-4	18 %
P-6	50 %
P-7	70 %

The above bioavailabilities correspond to sustained plasma levels of the active metabolite well above the ED<sub>50</sub> for HIV-1.

## Biological Example 6

Bioavailability of the ring indanolic ring hydroxy compound of Example B-1 was assessed in rats by the procedure of Biological Example 5 also using a propylene glycol vehicle, 58mg/kg (0.047 mmol/kg), but wherein the mother compound N1, N6-di [(1S,2R)-2-hydroxy-2,3-dihydro-1-*H*-1-indenyl]-(2R, 3R, 5R)-2,5-di(benzyloxy)-3,4-dihydroxyhexanediamide was assayed by LC-MS using SiM (single ion monitoring) with M/Z ion detector 653. Plasma results are presented as  $\mu$ M in the table below:

15

10015134 " 111601

Time	Rat 1	Rat 2	Rat 3
0	<0.02	<0.02	<0.02
0.5	0.17	0.46	0.23
1	0.73	1.4	1.22
2	0.86	1.7	1.09
4	0.52	0.67	0.43
6	0.23	0.24	0.08

The average bioavailability is thus 57%. This should be contrasted with the  
 5 bioavailability of the mother compound (below level of detection). Interestingly, the  
 bioavailability of the analogue bearing R<sub>2</sub> groups (depicted immediately below) but  
 lacking the linker component of the invention was also below the level of detection  
 in the same assay:

#### Biological Example A-1

15 The bioavailability of a prodrug of the invention built on the *bis*-phosphonate  
 alendronate was assayed in rats. 4-Amino-1-hydroxybutylidene-1,1-bisphosphonic  
 acid, di-(2-methyl-2-(L-valyloxymethyl) propionyloxymethyl) ester and the  
 alendronate mother compound were orally administered at a dose corresponding to  
 0.1 mmol/kg to respective paired rats in a propylene glycol vehicle.

Urine was collected over 24 hours in a metabolic cage and analysed as shown in Kline et al J Chromat. 534 (1990) 139-149, but modified as follows: 1 ml of urine is mixed with 50 µl of 1.25 M calcium chloride and 100 µl of 1M sodium hydroxide.

- 5 After centrifugation, the urine was aspirated off and the pellet redissolved in 0.8 ml 0.2 M acetic acid, 0.4 ml of 0.01 M EDTA and 0.4 ml of 0.2 M sodium acetate. 1 ml of water was added and the solution loaded onto a preconditioned DEA cartridge. The cartridge was washed with 1 ml of water and alendronate eluted with 1 ml of 1M carbonate buffer, pH 10.4. A part of the eluent, 150 µl was mixed with 5 µl of
- 10 0.05 M potassium cyanide and 5 µl of NDA solution (1 mg/ml) in methanol. 50 µl was injected into the chromatograph.

The compound of the invention exhibited a 28-30 fold improvement relative to the bioavailability of alendronate itself.
